D-Link DSL-2500U

ADSL2/2+ Ethernet Router

User Manual

D-Link®
Building Networks for People

RECYCLABLE

2006/08/30

Ver. 1.00

Table of Contents

General Information

The D-Link DSL-2500U is an ADSL2+ router for the main purpose of connecting to the Internet. This user manual provides you with a simple and easy-to-understand format to install and configure your router.

Package Contents

Included in the package is one of each of the following—

- DSL-2500U ADSL2/2+ Ethernet Router
- Power adapter
- RJ-11 telephone cable
- RJ-45 Ethernet cable
- CD-ROM *(contains User Manual / Quick Guide)*
- Quick Guide *(booklet)*

Important Safety Instructions

- Place your router on a flat surface close to the cables in a location with sufficient ventilation.
- To prevent overheating, do not obstruct the ventilation openings of this equipment.
- Plug this equipment into a surge protector to reduce the risk of damage from power surges and lightning strikes.
- Operate this equipment only from an electrical outlet with the correct power source as indicated on the adapter.
- Do not open the cover of this equipment. Opening the cover will void any warranties on the equipment.
- Unplug equipment first before cleaning. A damp cloth can be used to clean the equipment. Do not use liquid / aerosol cleaners or magnetic / static cleaning devices.

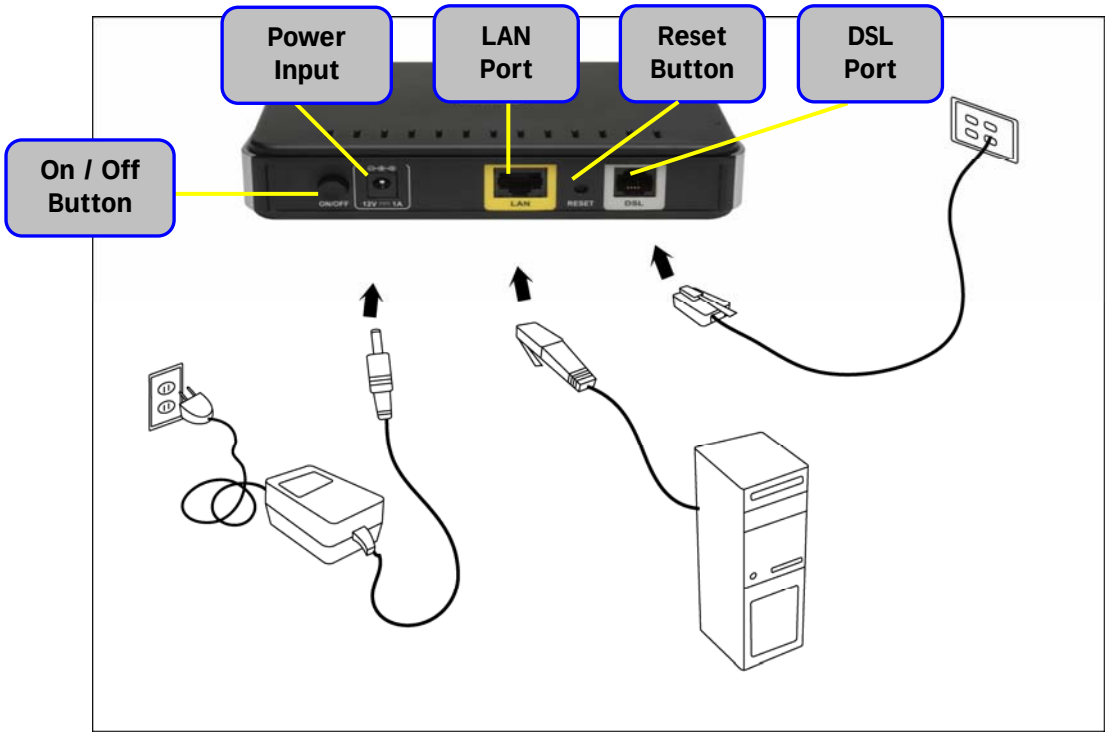
Front Panel View

LED	Mode	Indication
Power	Solid Green	The router is powered on. **(READY)**
	No light	The power is off.
	Solid Red	Failure or device malfunction. **(NOT READY)**
Status	Blinking Green	Traffic is passing through the device. **(INTERNET TRAFFIC)**
DSL	Solid Green	DSL is synchronized.
	No Light	No carrier signal.
	Slow Blinking	DSL attempting synch. Trying to detect carrier signal.
	Fast Blinking	Carrier has been detected and modem is trying to train.
LAN	Solid Green	Powered device connected to associated port
	Blinking Green	LAN activity present (traffic in either direction).
	No Light	No activity, modem power off, no cable or no powered device is connected to the LAN port.
Internet	Solid Green	IP connected (device has a WAN IP address from IPCP or DHCP and DSL is up or a static IP address is configured, PPP negotiation has completed successfully (if used), and DSL is up. **(WAN IP AVAILABLE)**
	No Light	Modem power off, modem in bridge mode or ADSL connection not present.
	Solid Red	Device attempted to become IP connected and failed (no DHCP response, no PPPoE response, PPPoE authentication failed, no IP address from IPCP, etc.). **(WAN IP NOT AVAILABLE)**

Back Panel View

Port	Description
On/ Off	Press to turn the router on and off.
AC 15V-D.7A	Connects to the power adapter.
LAN	RJ-45 connects the unit to an Ethernet device such as a PC or a switch.
Reset	Resets the router to its default settings.
DSL	RJ-11 telephone port connects telephone cable to telephone or fax machine.

Connecting the Router to Your Computer



Connect the ADSL Line and Telephone

- Connect one end of the telephone cable to the **DSL port** on the router and the other end of the cable into the wall socket.

Connect the PC to the Router

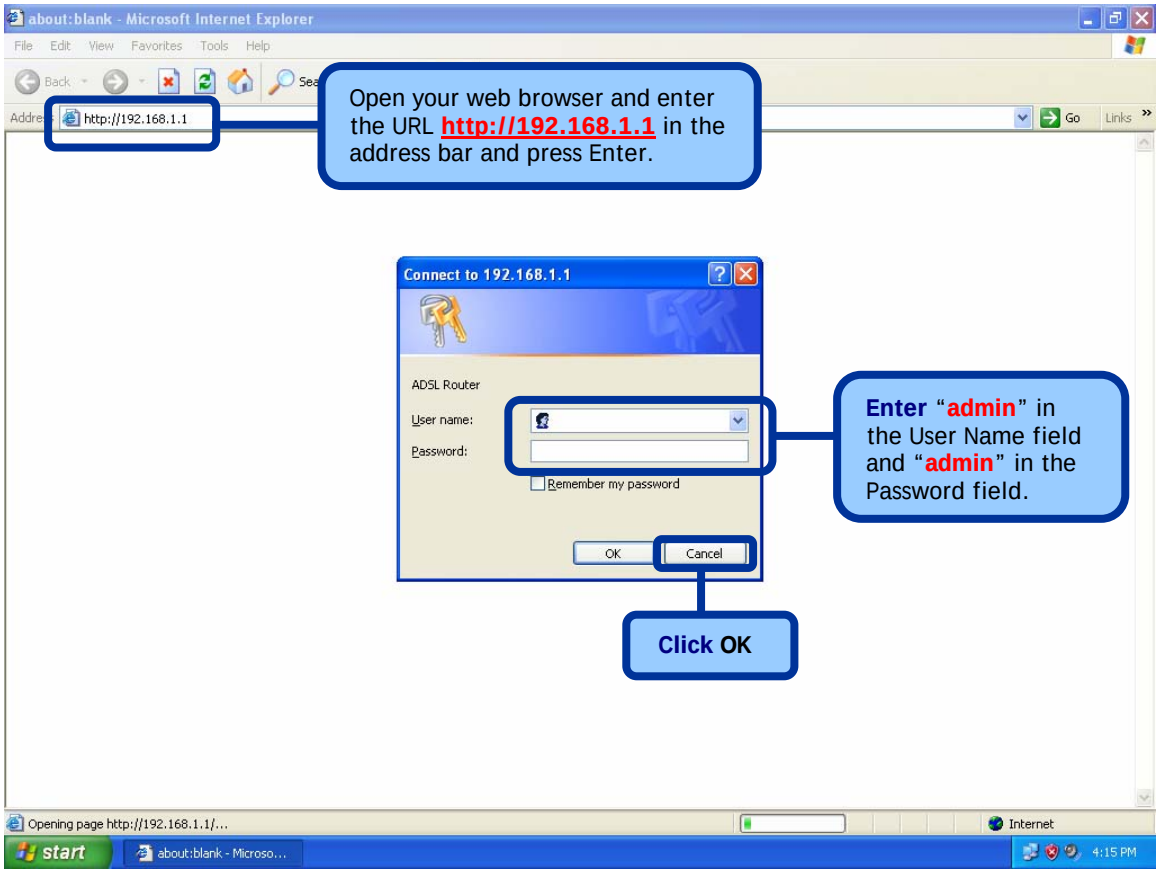
- Connect one end of the Ethernet cable to the **LAN port** on the back of the router and attach the other end to an Ethernet Adapter or available Ethernet port on your computer.

Connect the Power Adapter

- Complete the process by connecting the power adapter to the **Power input** on the back of the router and then plug the other end of power adapter into a wall outlet or power strip. Then turn on the router and boot up your PC and any LAN devices, such as hubs or switches, and any computers connected to them.

Configuring Your Router

To use your web browser to access the web pages used to set up the router, your computer must be configured to **"Obtain an IP address automatically"**, that is, you must change the IP network settings of your computer so that it is a **DHCP client**. If you are using Windows XP and do not know how to change your network settings, skip ahead to **Appendix A** and read the instructions provided.



Home

The home section provides configurations for general use, including a Quick Setup Wizard with steps to quickly set up your router for Internet connection. Also included in this section are LAN / WAN setup and DNS configuration. The below sections explains the setup for each.

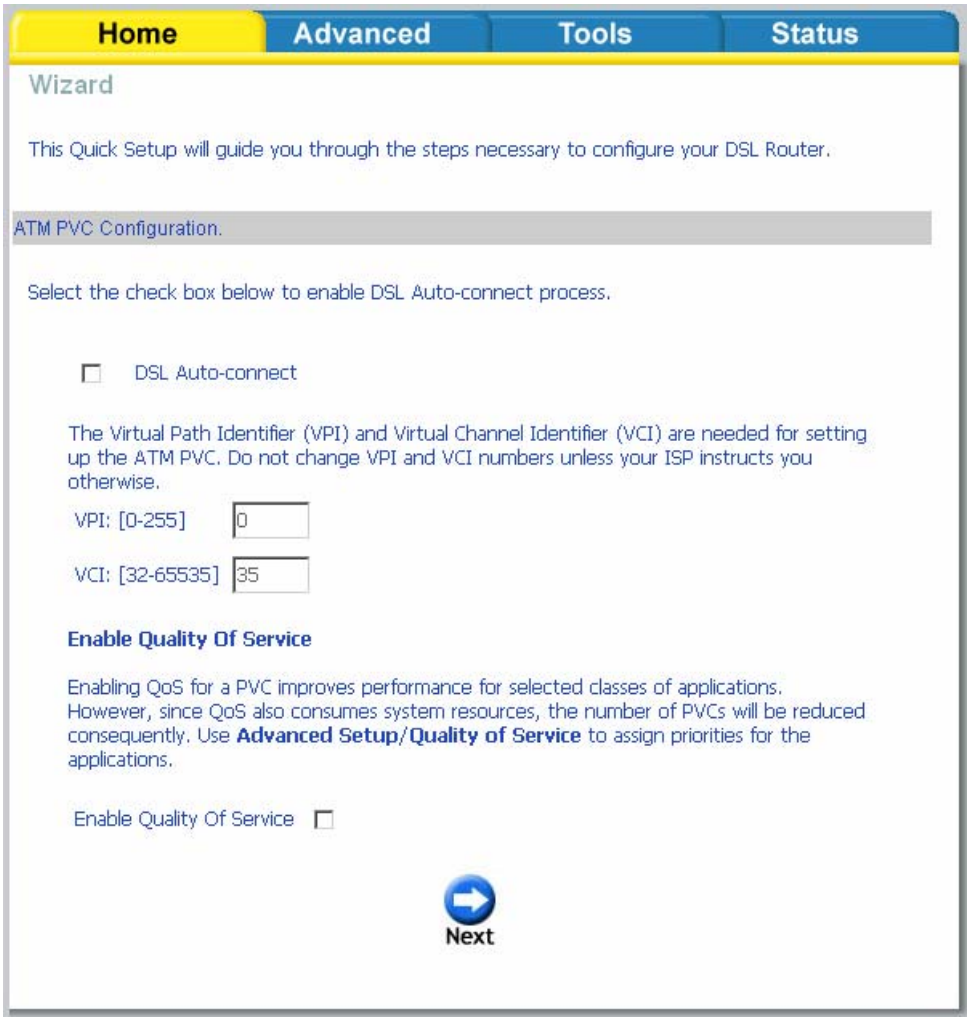
Wizard

This section will explain how to quickly configure the router if your only intention is to access the Internet.

ATM PVC Configuration

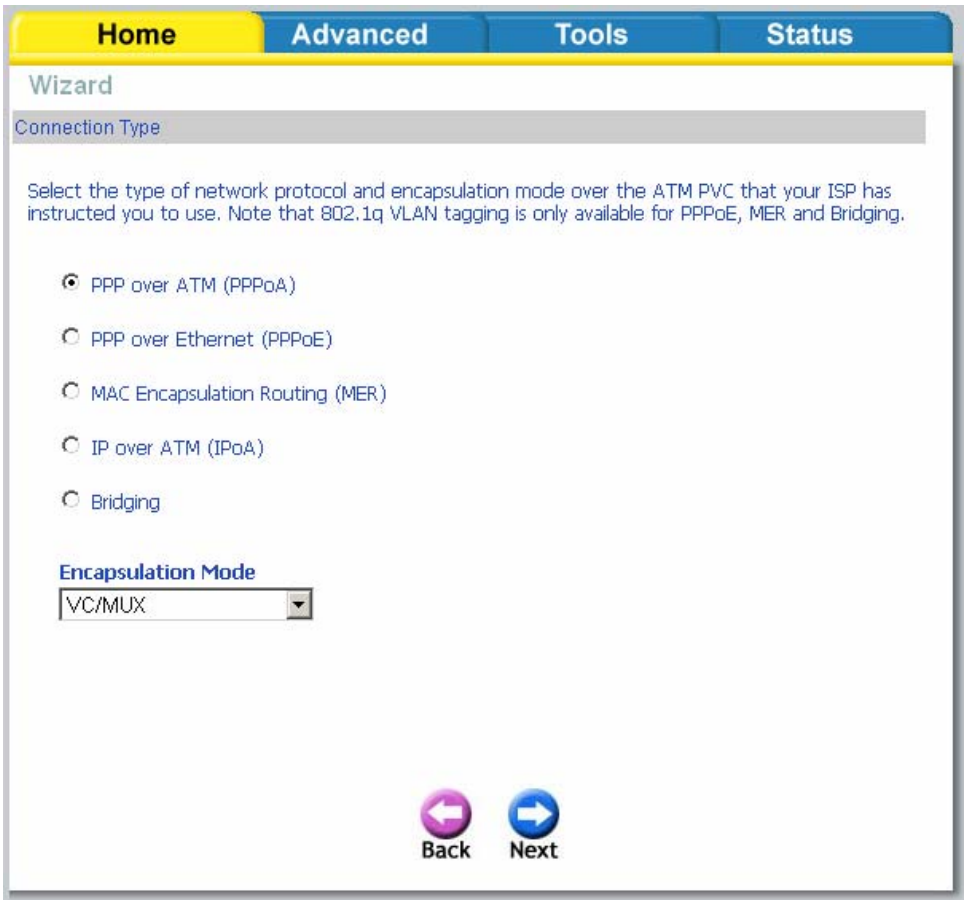
To enable the auto-connect process, click on the box labeled DSL Auto-connect, a process that will automatically detect the first usable PVC and automatically detect PPPoE, PPPoA, and Bridge Protocol (with DHCP Server available). To continue, click on the **Next** button.

If you uncheck the *DSL Auto-connect* box, the resulting screen is seen below. Enter the VPI / VCI as indicated by your ISP. Also shown will be the Quality of Service.



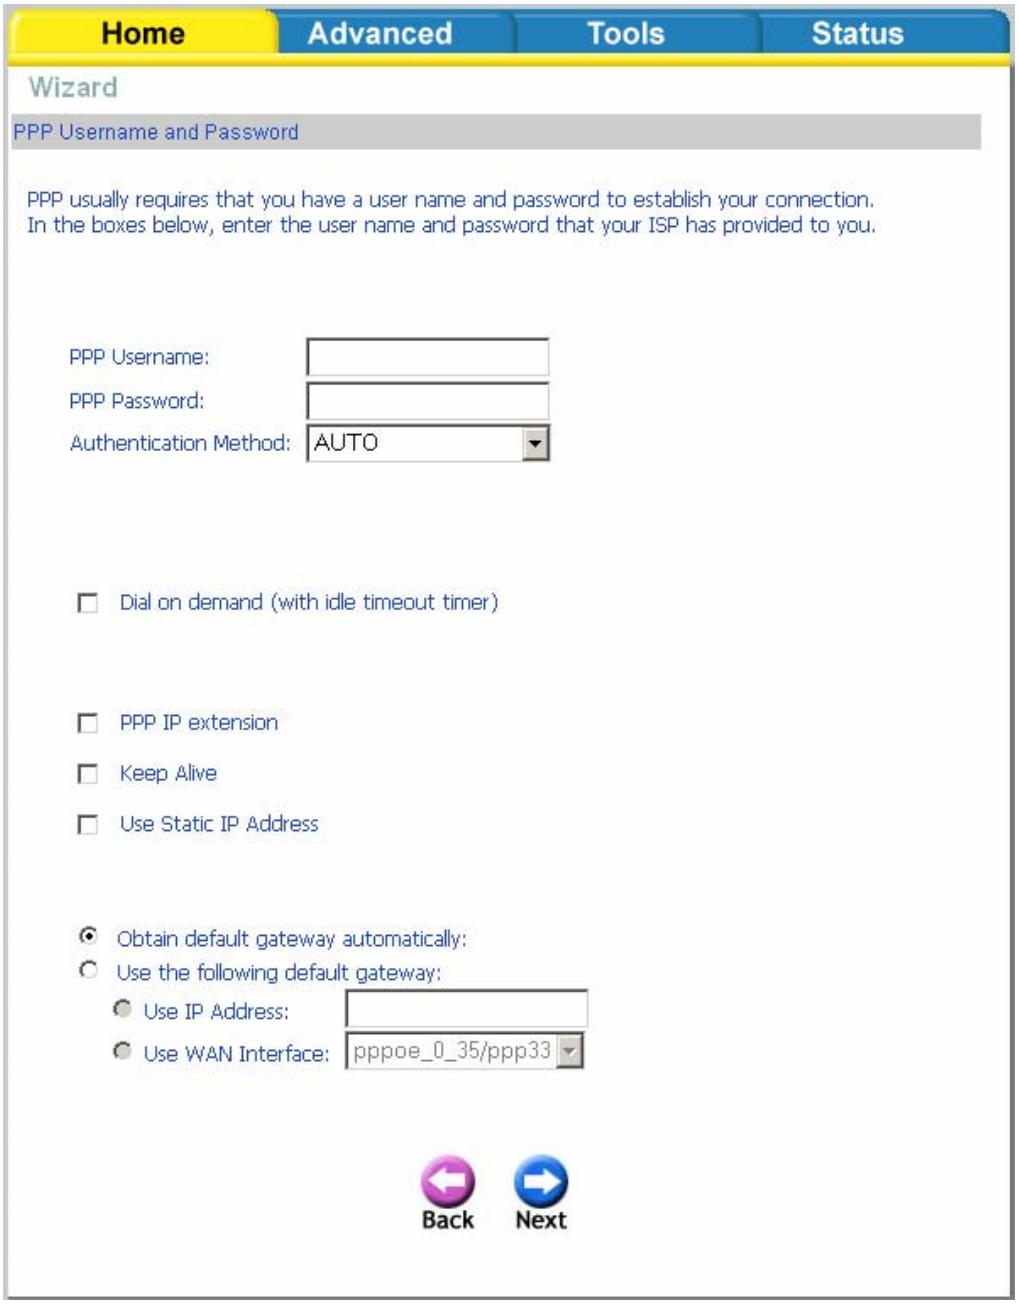
Connection Type

Following is the Connection Type screen where you select the type of network protocol and encapsulation mode over the ATM PVC that your ISP has instructed you to use. The following is a PPPoA example. Click on **Next** to continue.



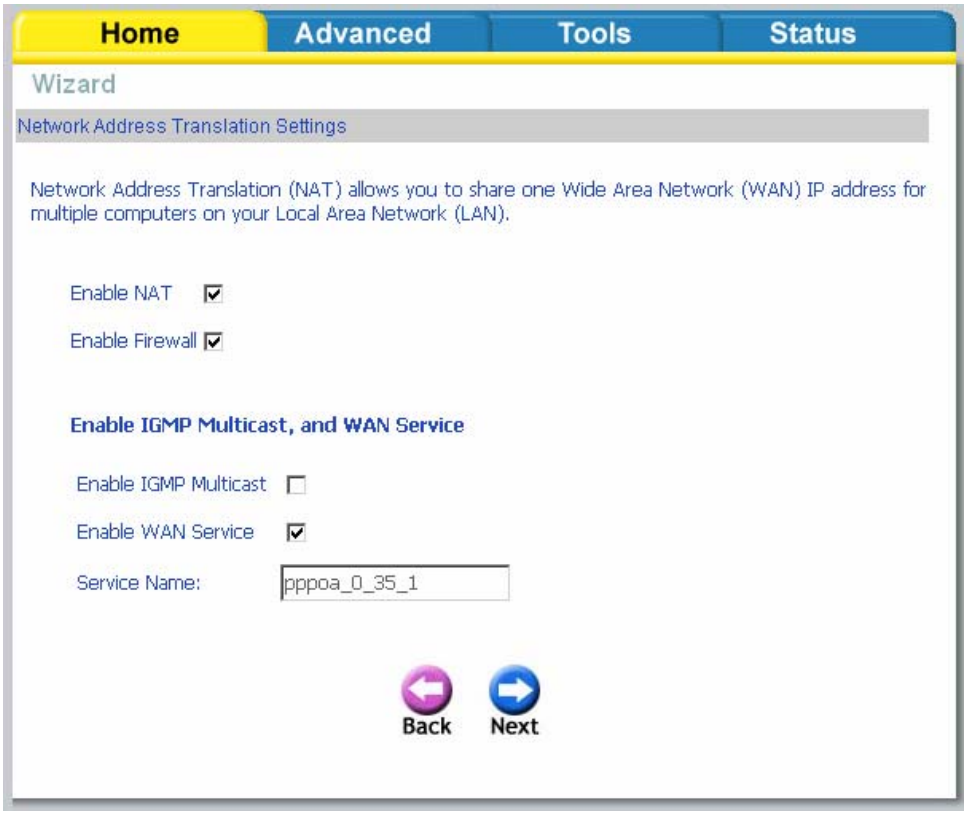
PPP Username and Password

Enter the PPP username and password as given by your ISP. Then decide if you will be using any features such as *dial on demand, PPP IP extension, keep alive* and then click on **Next**.



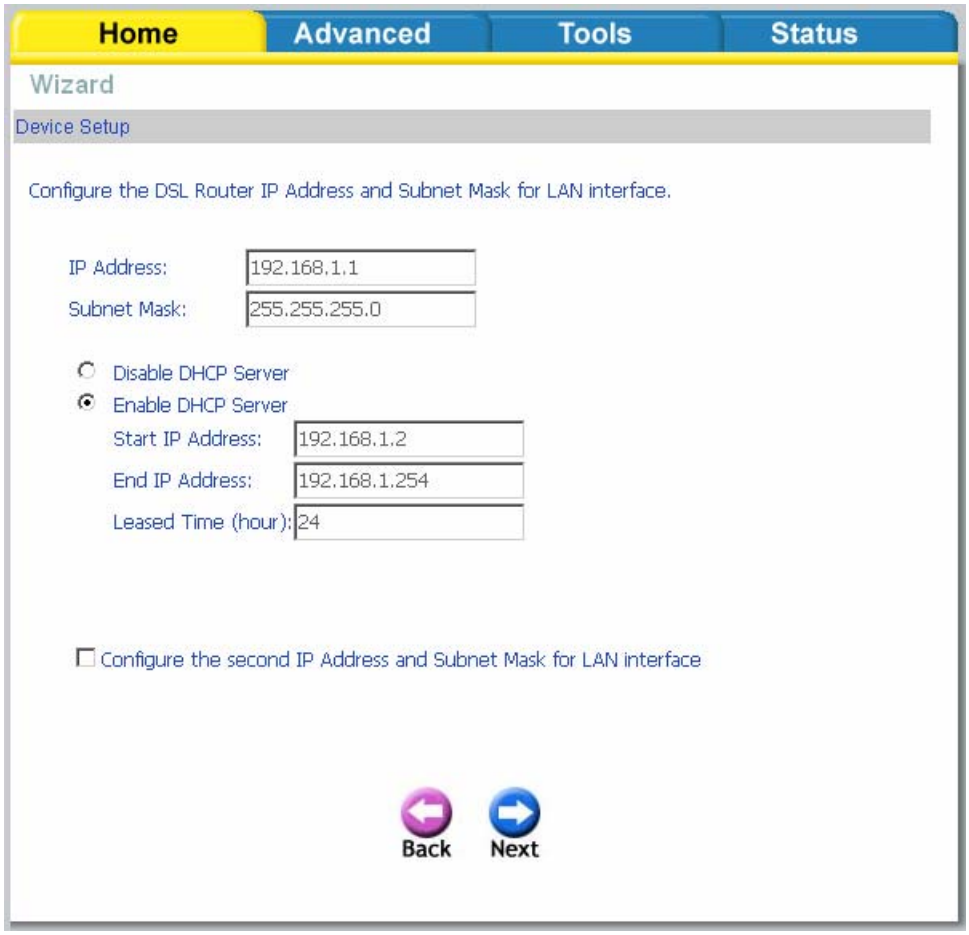
Network Address Translation Settings

The next step is to configure the Network Address Translation (NAT) settings. For the example, NAT will be enabled. The remaining fields are left as default and then click on **Next** to continue.



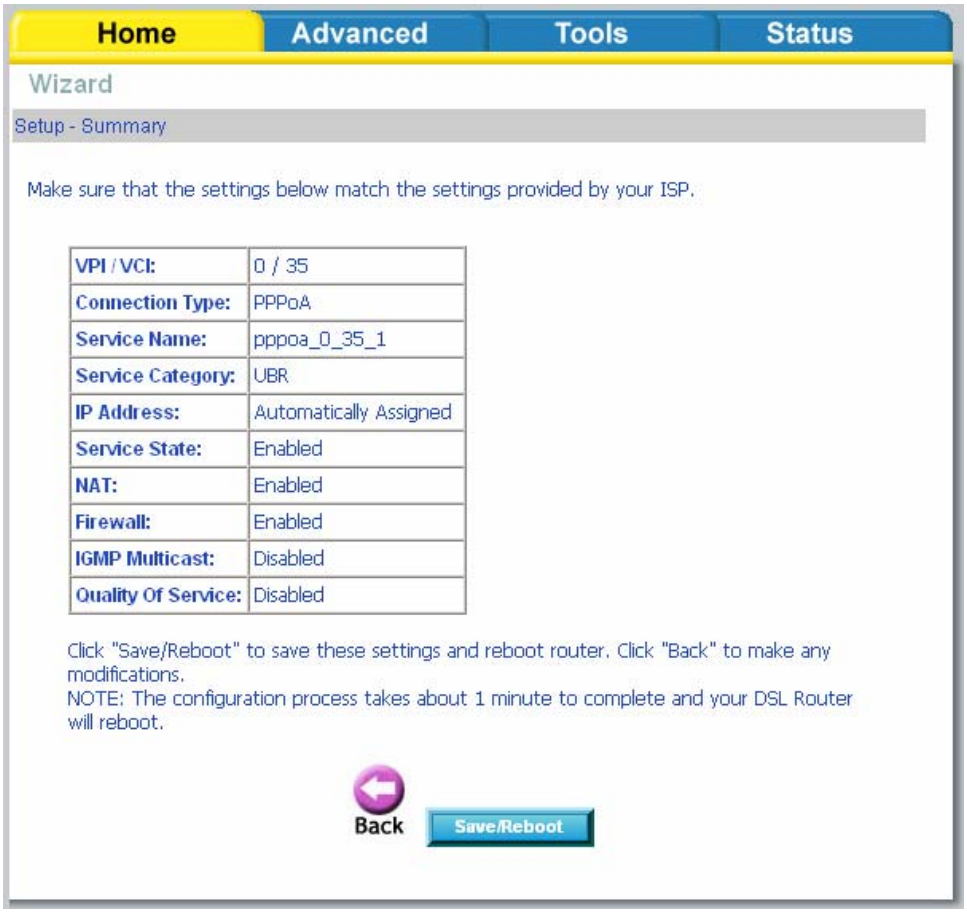
Device Setup

You can configure the DSL Router IP address and Subnet Mask for the LAN interface to correspond to your LAN's IP Subnet. If you want the DHCP server to automatically assign IP addresses, then enable the DHCP server and enter the range of IP addresses that the DHCP server can assign to your computers. Disable the DHCP server if you would like to manually assign IP addresses. Click on **Next** to continue.



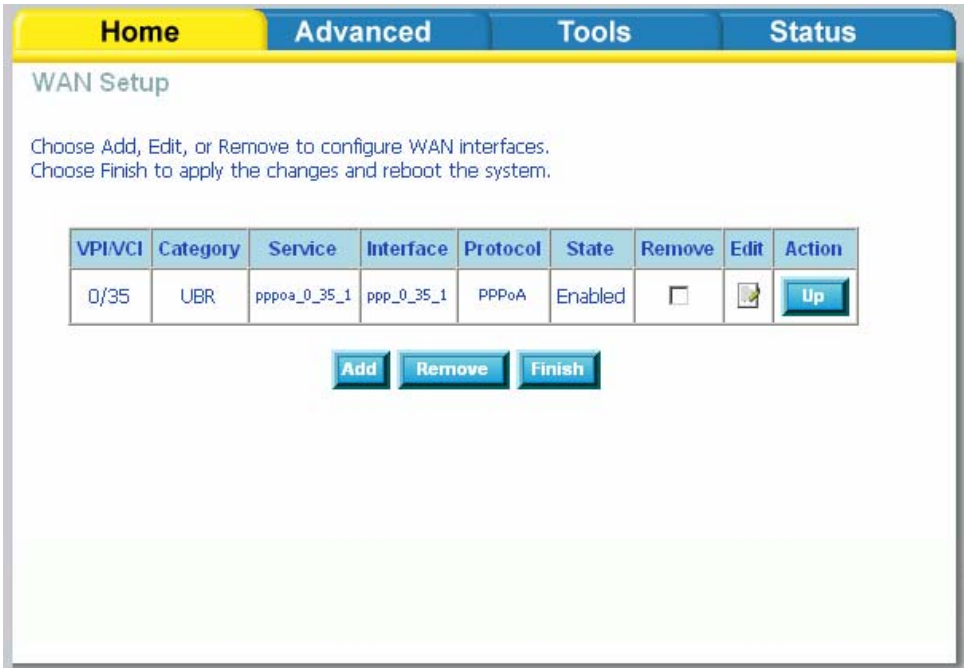
Setup - Summary

After all of the WAN configurations are done, the *WAN Setup Summary* screen displays all WAN settings that you have made. Check that the settings are correct before clicking on the **Save / Reboot** button. Clicking on **Save / Reboot** will save your settings and restart your router.



WAN

Configure the WAN settings as provided by your ISP.



Click on the **Add** button if you want to add a new connection for the WAN interface and to proceed to the ATM PVC Configuration screen as seen below. The ATM PVC Configuration screen allows you to configure an ATM PVC identifier (VPI and VCI) and select a service category.

Find out the following values from your ISP before you change them.

- **VPI**: Virtual Path Identifier. The valid range is 0 to 255.
- **VCI**: Virtual Channel Identifier. The valid range is 32 to 65535.
- **Service Category**: Five classes of traffic are listed—

    - **UBR Without PCR** *(Unspecified Bit Rate without Peak Cell Rate)*—UBR service is suitable for applications that can tolerate variable delays and some cell losses. Applications suitable for UBR service include text/data/image transfer, messaging, distribution, and retrieval and also for remote terminal applications such as telecommuting.

    - **UBR With PCR** *(Unspecified Bit Rate with Peak Cell Rate)*--

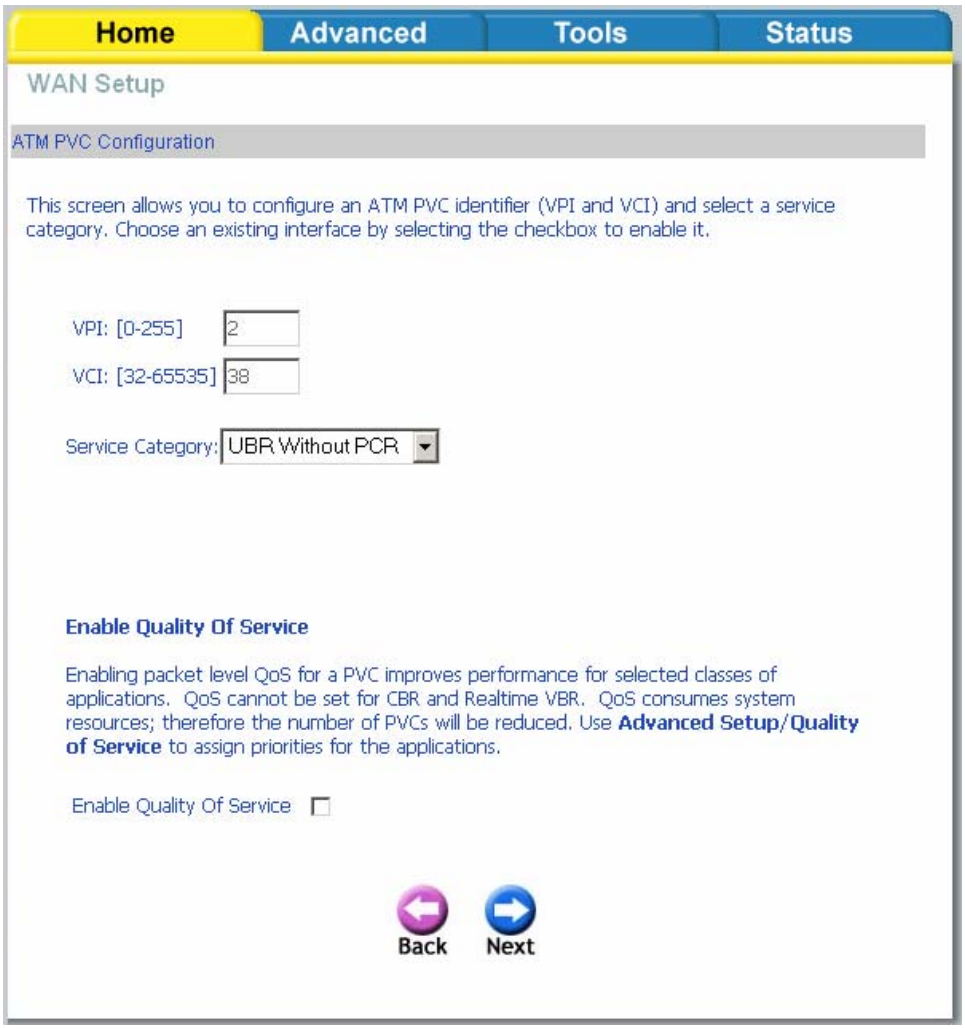
    - **CBR** *(Constant Bit Rate)*—used by applications that require a fixed data rate that is continuously available during the connection time. It is commonly used for uncompressed audio and video information such as videoconferencing, interactive audio (telephony), audio / video distribution (e.g. television, distance learning, and pay-per-view), and audio / video retrieval (e.g. video-on-demand and audio library).

    - **Non Realtime VBR** *(Non-Real-time Variable Bit Rate)*—can be used for data transfers that have critical response-time requirements such as airline reservations, banking transactions, and process

monitoring.

- **Realtime VBR** *(Real-time Variable Bit Rate)*—used by time-sensitive applications such as real-time video. Rt-VBR service allows the network more flexibility than CBR.

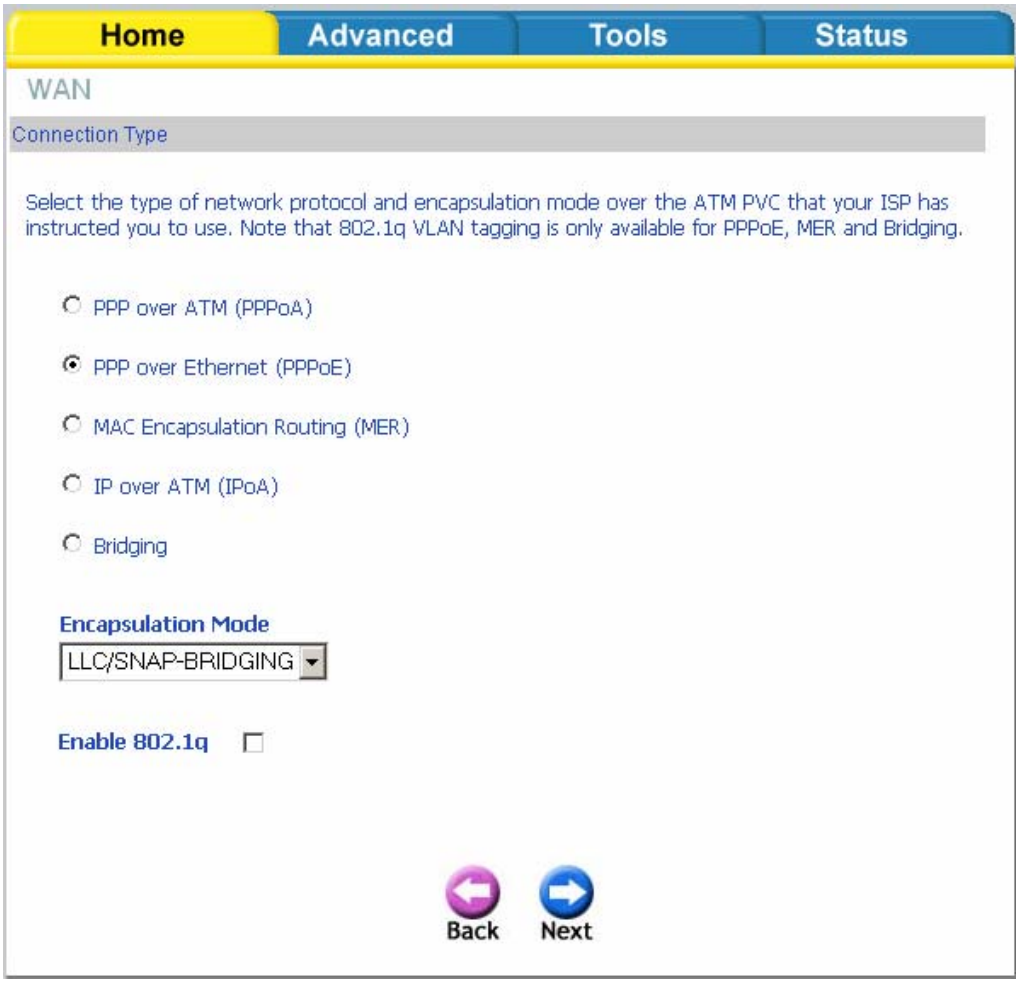
- **Quality of Service**: Can be enabled only for *UBR without PCR*, *UBR with PCR*, and *Non Realtime VPR*.



The following screen shows the below types of network protocols and encapsulation modes—

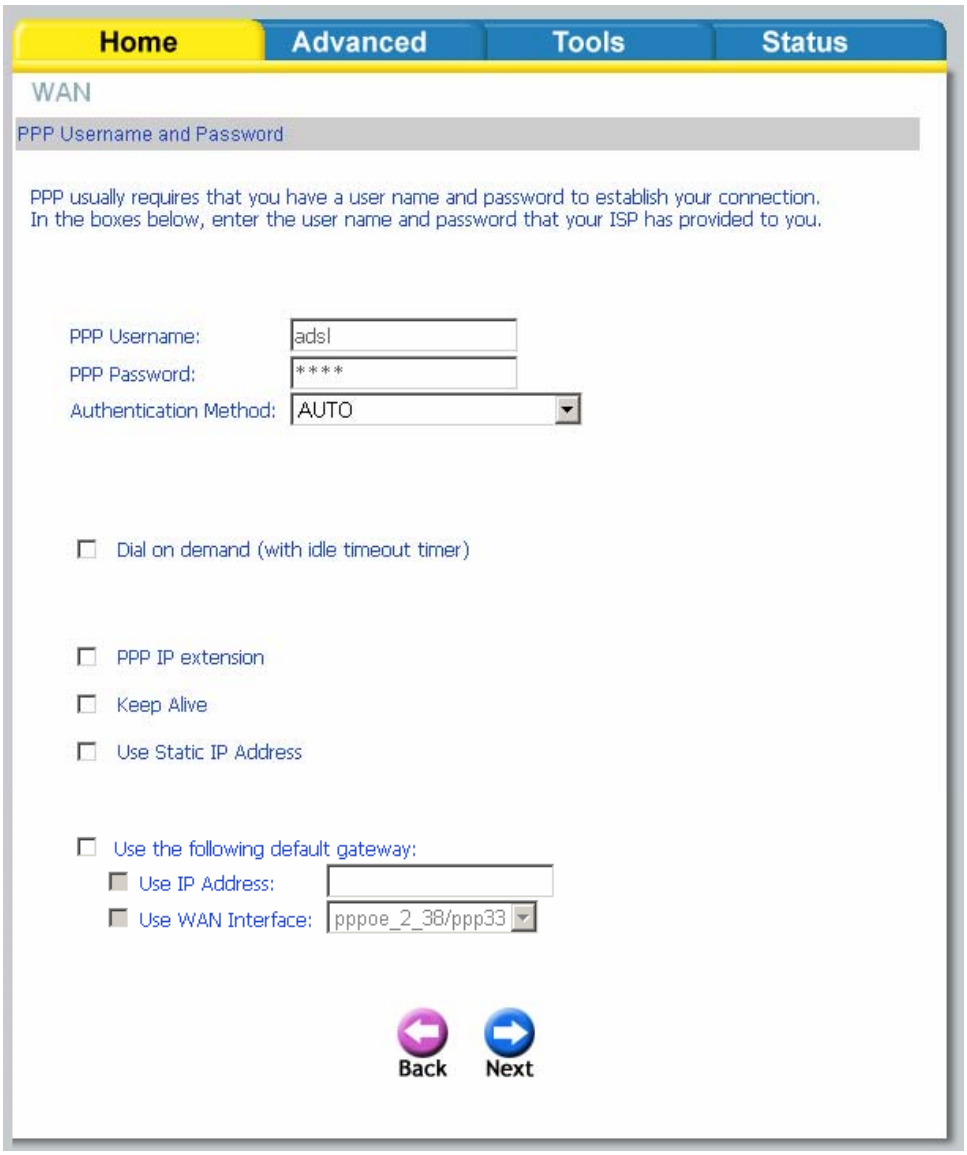
- PPP over ATM (PPPoA)
- PPP over Ethernet (PPPoE)
- MAC Encapsulation Routing (MER)
- IP over ATM (IpoA)
- Bridging

If you will be using VLAN tagging, then click on the **Enable 802.1q** checkbox and then enter the VLAN ID number. *Note that the 802.1q function is only available if you select PPPoE, MER, or Bridging.* When finished with your selections, click on **Next** to continue.



The following screen allows you to enter PPP username and password as well as make any selections regarding your connection.

- **Dial on demand**: Allows you to manually connect to the Internet so you are not permanently connected. Idle timeout timer is included.
- **PPP IP extension**: Used by some ISP's. Check with your ISP to see if it is required.
- **Keep alive**: Keeps you connected to your ISP even when no activity is present for a certain period of time.
- **Use static IP address**: Select if you want to use a non-DHCP issued IP address to connect to the Internet. If selected, you will be asked to enter the static IP address.



Home

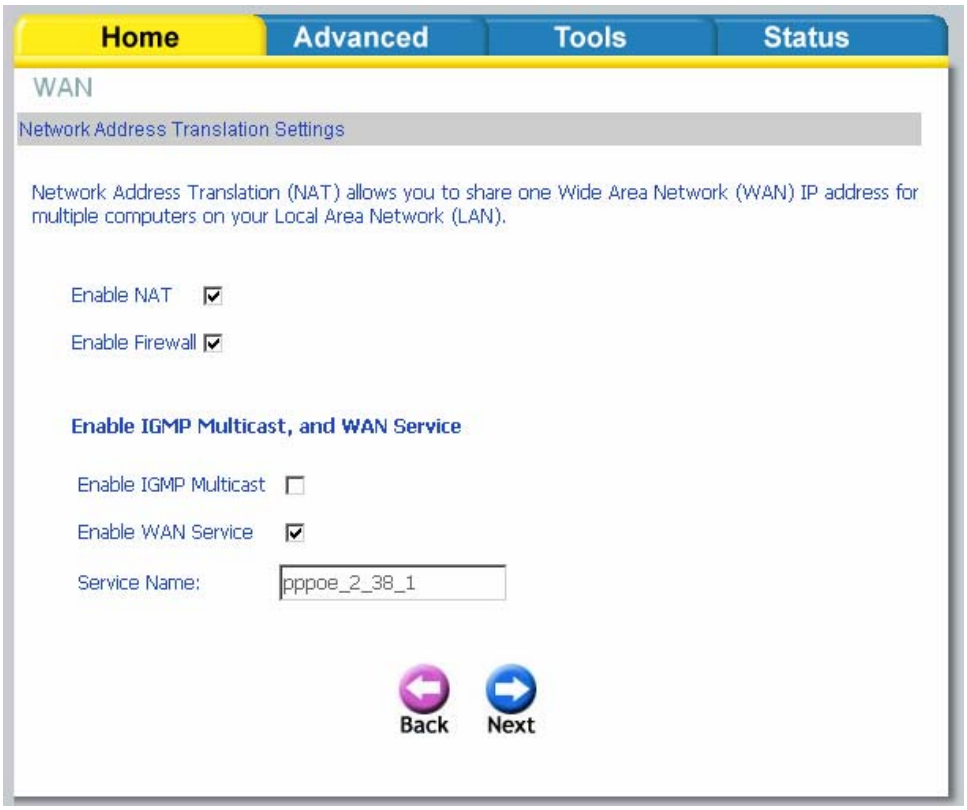
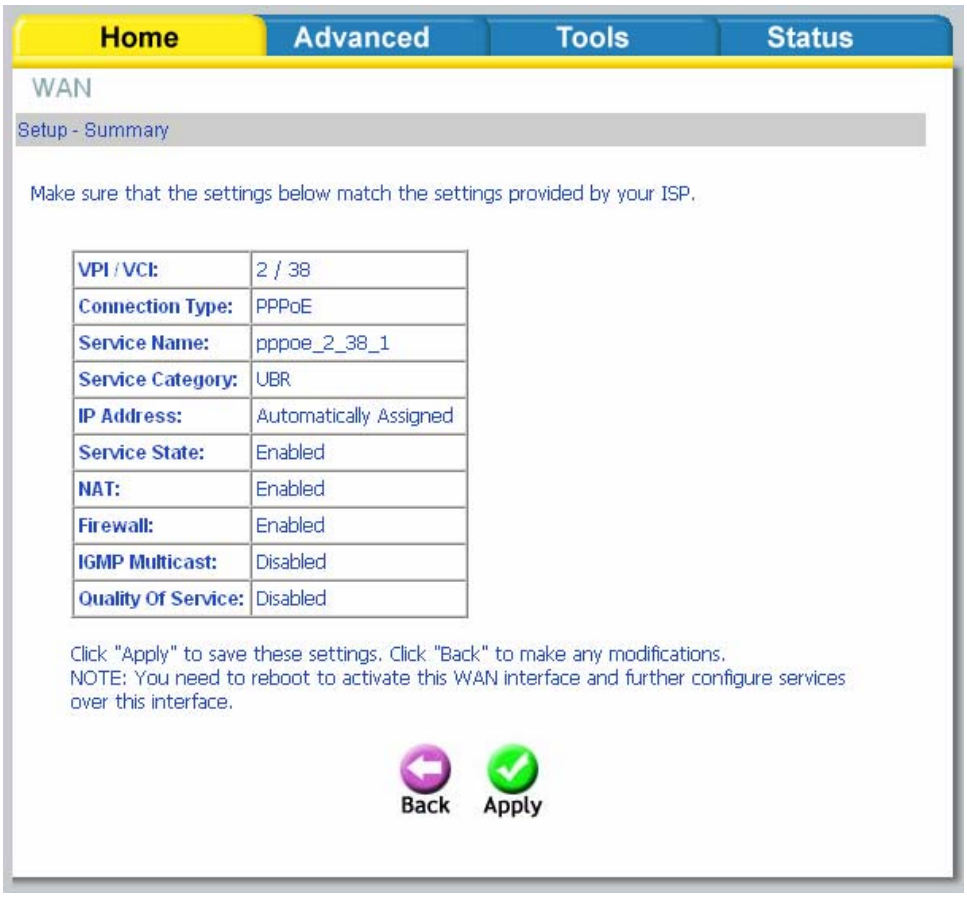
Tools
Status
WAN
PPP Username and Password
PPP usually requires that you have a user name and password to establish your connection.
In the boxes below, enter the user name and password that your ISP has provided to you.
PPP Username:
adsl
PPP Password:
****
Authentication Method:
AUTO
Dial on demand (with idle timeout timer)
PPP IP extension
Keep Alive
Use Static IP Address
Use the following default gateway:
Use IP Address:
Use WAN Interface:
pppoe_2_38/ppp33
Back
Next

When finished, click on **Next** to proceed to the NAT Settings screen.

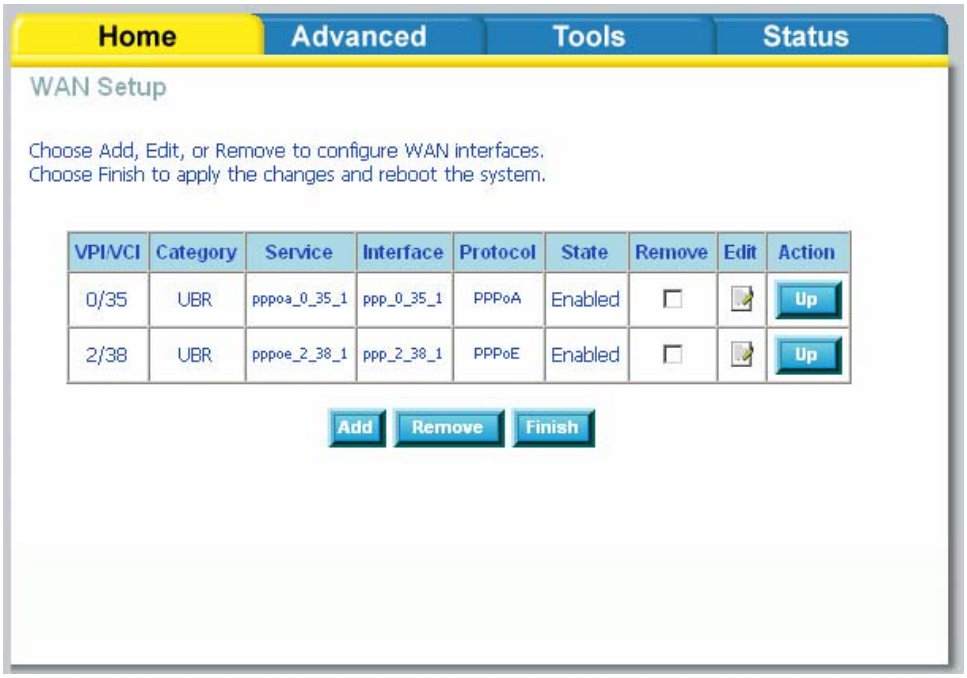
- **Enable NAT**: Select enable if you wish to share one WAN IP address for multiple computers on your LAN.
- **Enable Firewall**: Select if you wish to enable the router's firewall for security.
- **Enable IGMP Multicast**: Select enable if you wish to be able to provide multicasts, mostly used in video streaming.
- **Enable WAN Service**: Select if you wish to use WAN service and then set the service name.



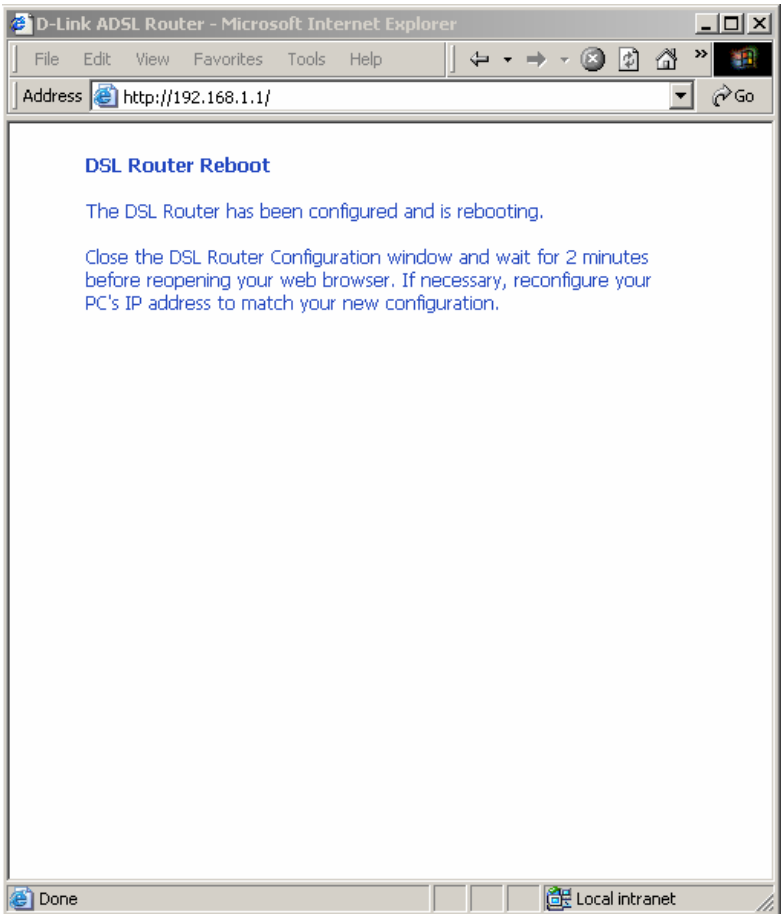
Click **Next** when finished with your configurations and the below screen will follow displaying the WAN settings that you made. When satisfied with the settings click on the **Apply** button.



After you apply the configurations, it will return to the WAN Setup screen showing the new configurations. Select the **Finish** button to save the changes and reboot the router.



Below is the DSL Router Reboot screen that will appear during the rebooting process.

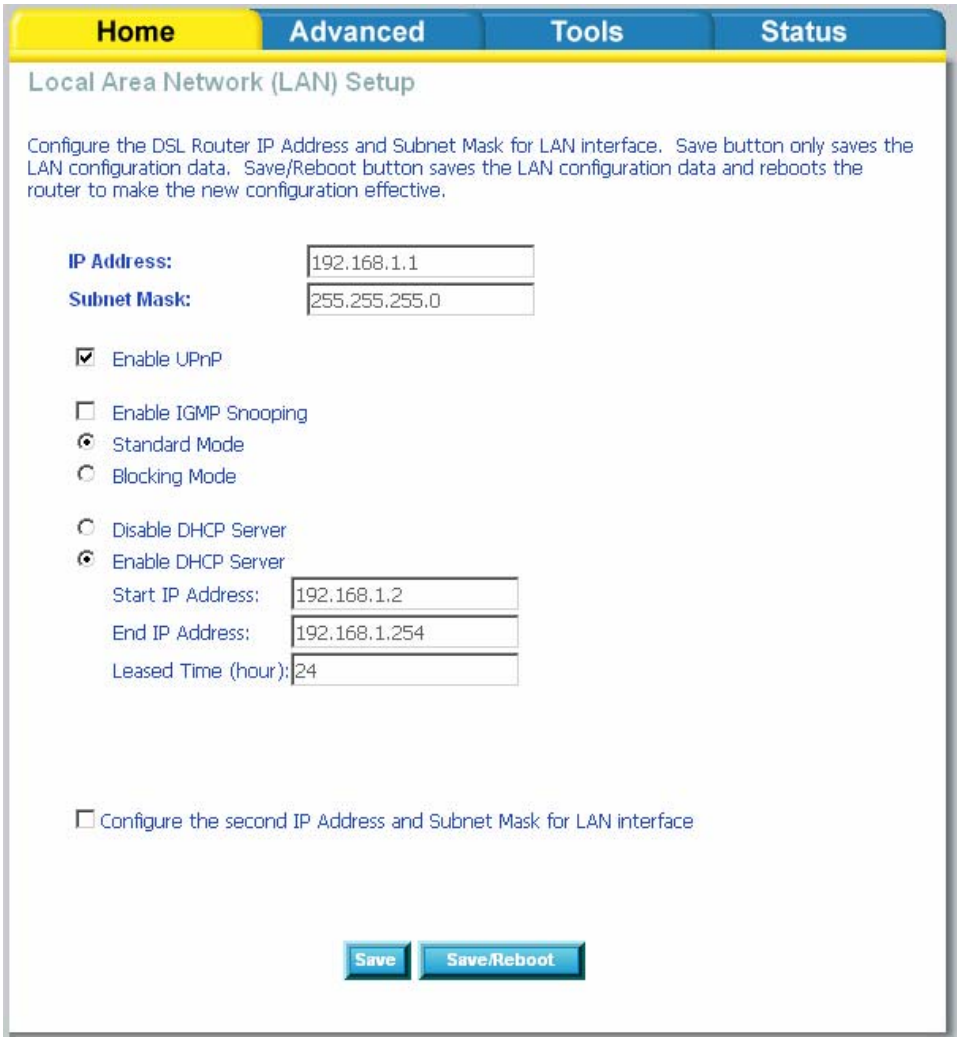


LAN

You can configure the DSL Router IP address and Subnet Mask for the LAN interface.

An available option if you will be multicasting is IGMP snooping, for which you can also select standard or blocking mode.

If you want the DHCP server to automatically assign IP addresses, enable DHCP server and enter the range of IP addresses that DHCP server can assign. Disable DHCP server if you would like to manually assign IP addresses.

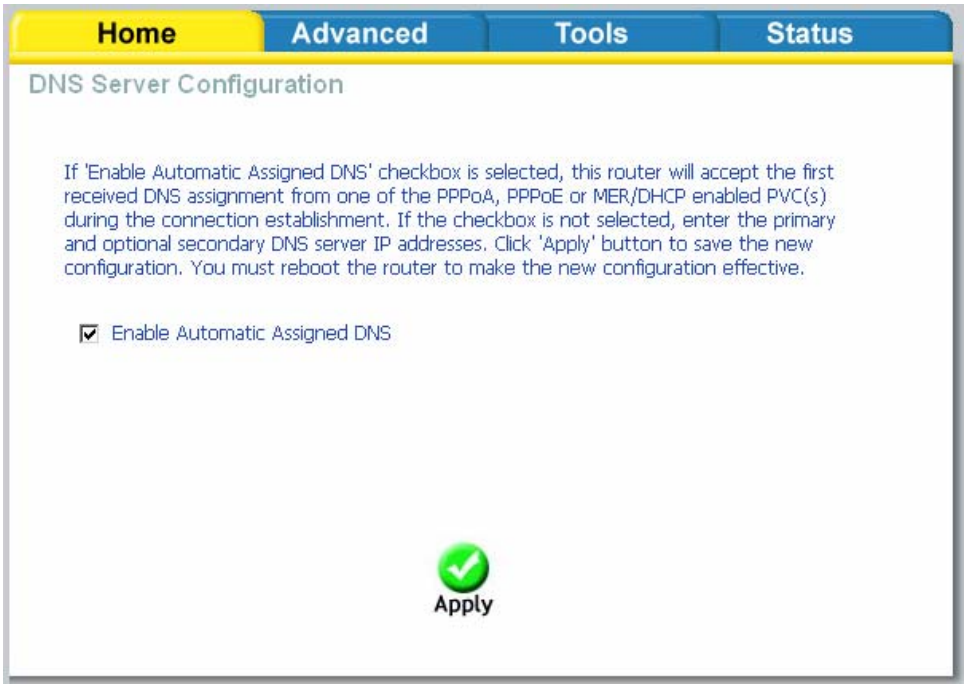


The **Save** button only saves the LAN configuration data, but does not apply the configurations. Select the **Save/Reboot** button to save the LAN configuration data and reboot the router and apply the new configurations.

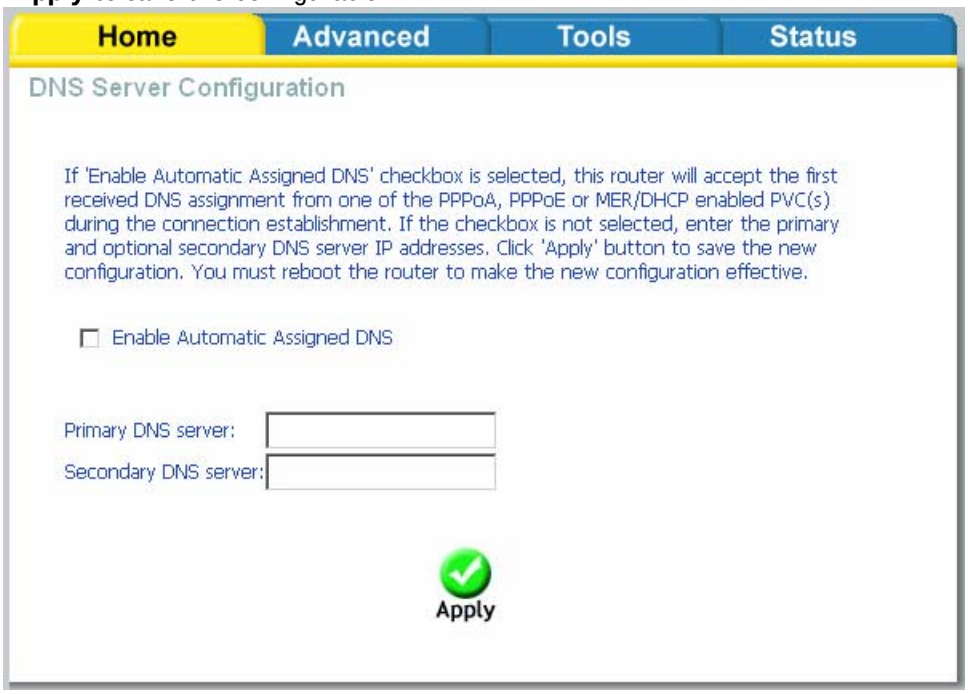
DNS

DNS Server Configuration

Use the DNS Server screen to request automatic assignment of a DNS or to specify a primary and secondary DNS.

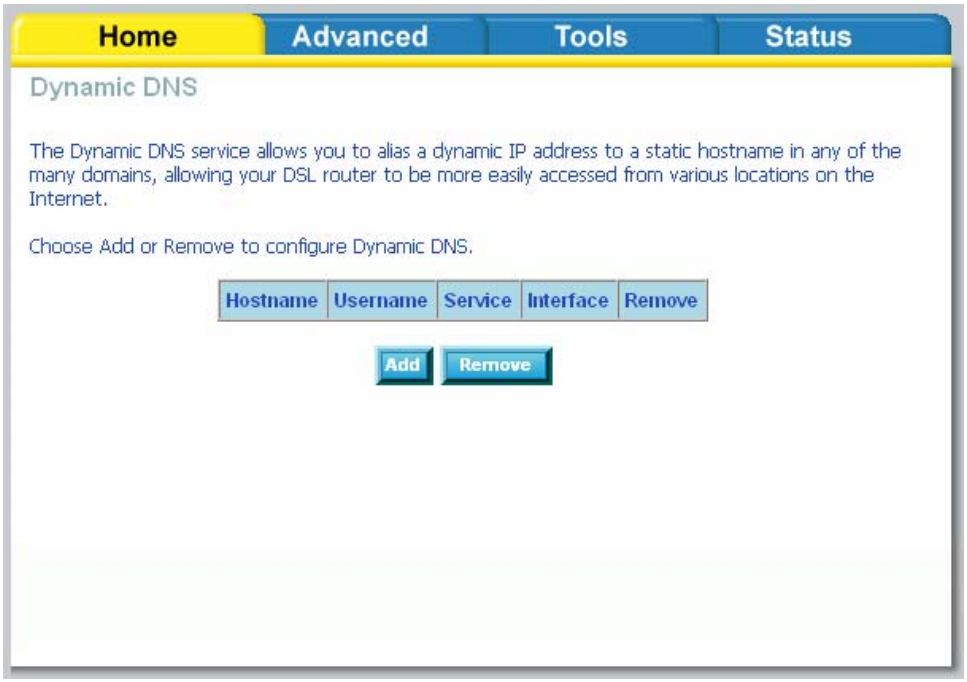


If you uncheck the *Enable Automatic Assigned DNS* checkbox, there will appear two additional fields—primary and secondary DNS server—to enter as seen below. Click on **Apply** to save the configuration.

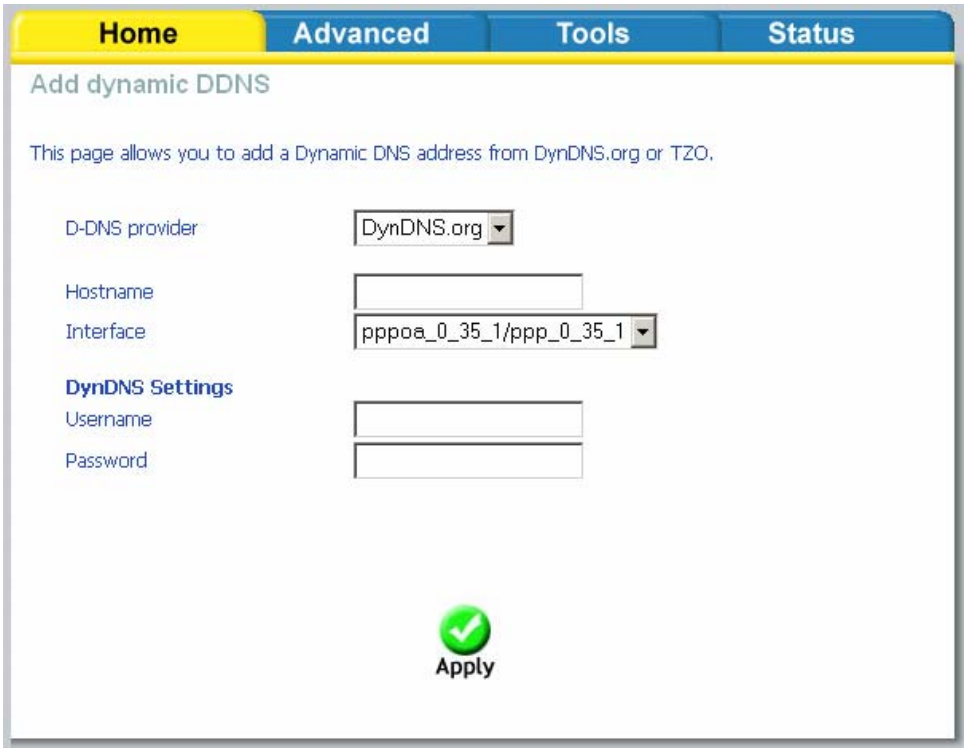


Dynamic DNS

Dynamic DNS is a service for allowing an Internet domain name to be assigned to a varying IP address. This makes it possible for other sites on the Internet to establish connections to you without needing to track the IP address themselves. Click on **Add** to set up a dynamic DNS configuration.

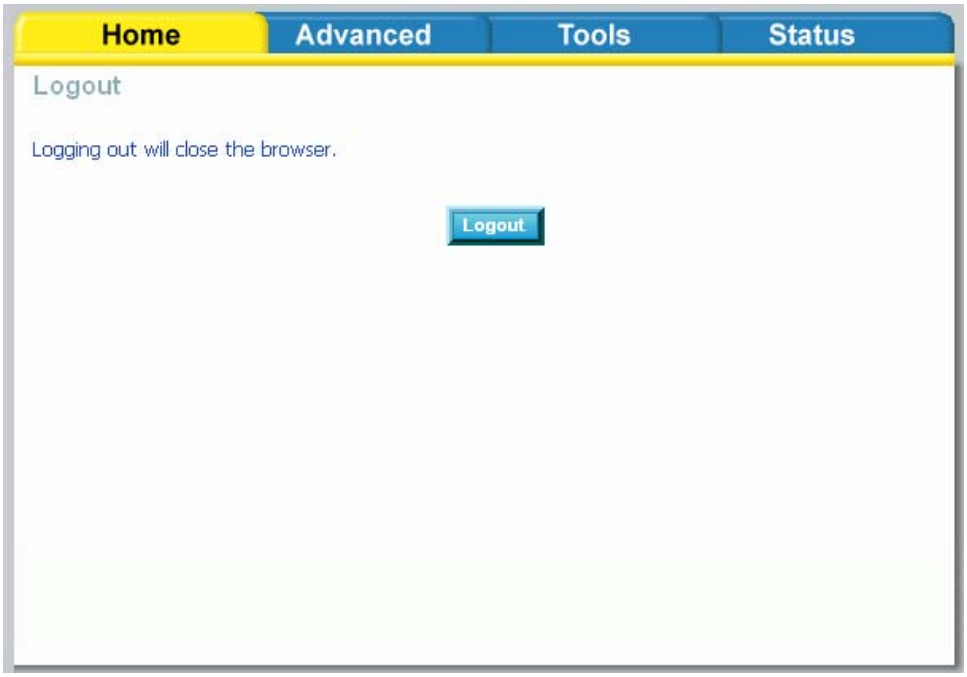


This screen allows you to add a dynamic DNS address from DynDNS.org or TZO. First select the D-DNS provider—*DynDNS.org* or *TZO*—from which you have obtained a dynamic DNS address. Enter the hostname and the interface that you are using. Also enter the username and password assigned by the DNS service. Click on **Apply** to save these configurations.



Logout

To log out of the router's user interface at any time during the setup, click on the **Logout** button. A confirmation screen will appear confirming that you really want to log out.



Advanced Setup

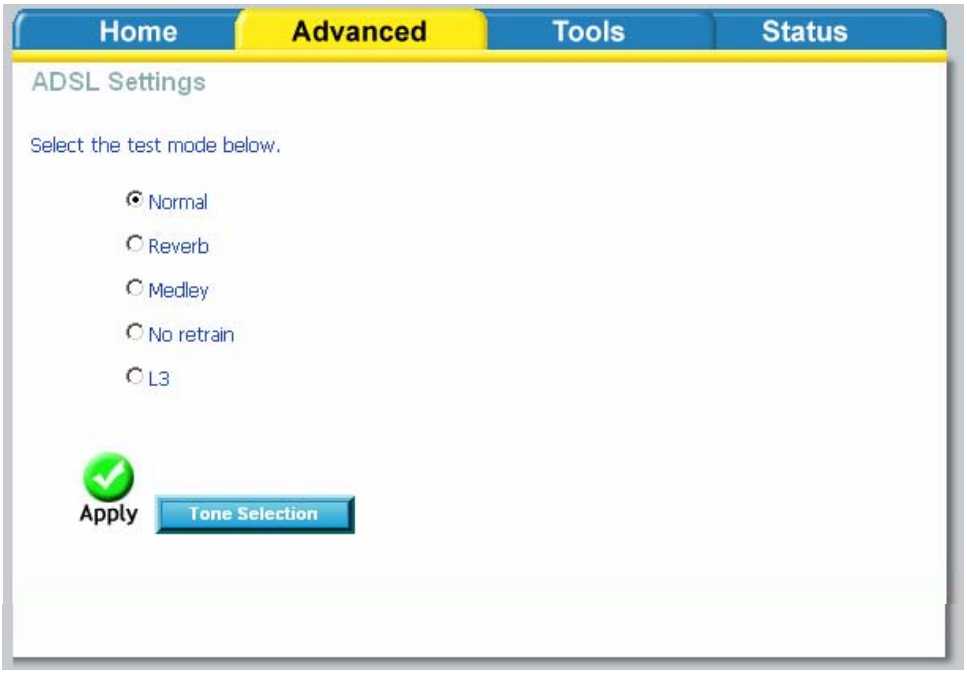
This section of the setup is an advanced version of the quick setup. If you want to make specific configurations to your router such as creating a virtual server, DMZ, RIP, Quality of Service (QoS), etc., consider going through this advanced setup for a more comprehensive configuration.

ADSL

The ADSL settings page contains a modulation and capability section to be specified by your ISP. Consult your ISP to select the correct settings for each. Then click on **Apply** if you are finished or click on **Advanced Settings** if you want to configure more advanced settings.

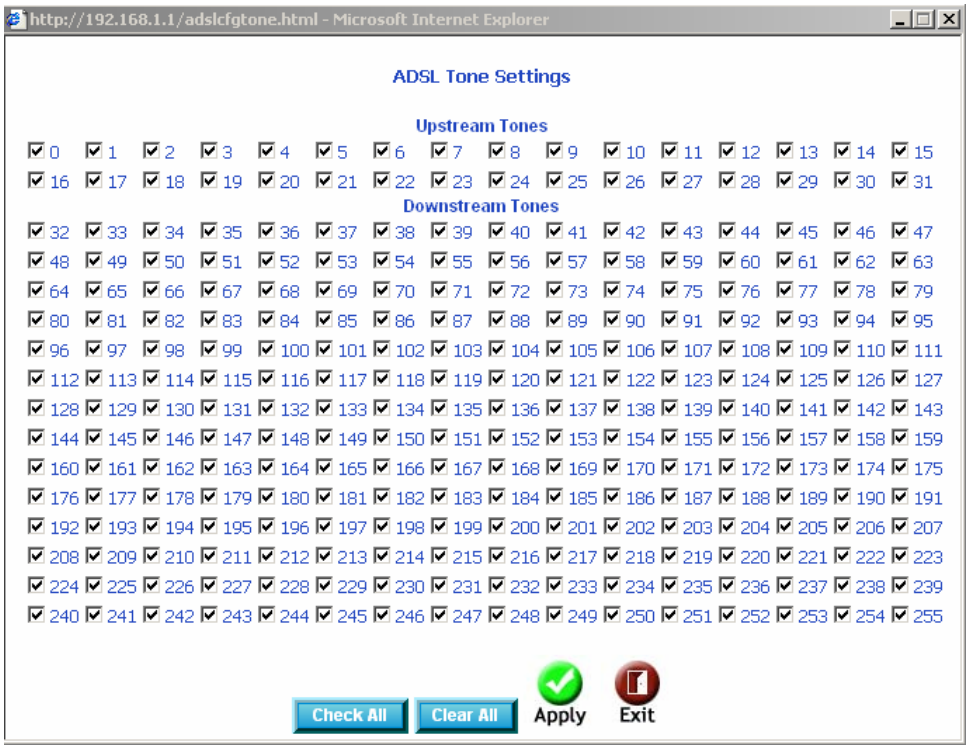
ADSL Settings

The test mode can be selected from the DSL Advanced Settings page. Test modes include—normal, reverb, medley, no retrain, and L3. After you make your selections of the test mode, click on **Apply** to save these settings first before you go to *Tone Selection.*



ADSL Tone Settings

The frequency band of ADSL is split up into 256 separate tones, each spaced 4.3125 kHz apart. With each tone carrying separate data, the technique operates as if 256 separate modems were running in parallel. The tone range is from 0 to 31 for upstream and from 32 to 255 for downstream. Do not change these settings unless directed by your ISP.



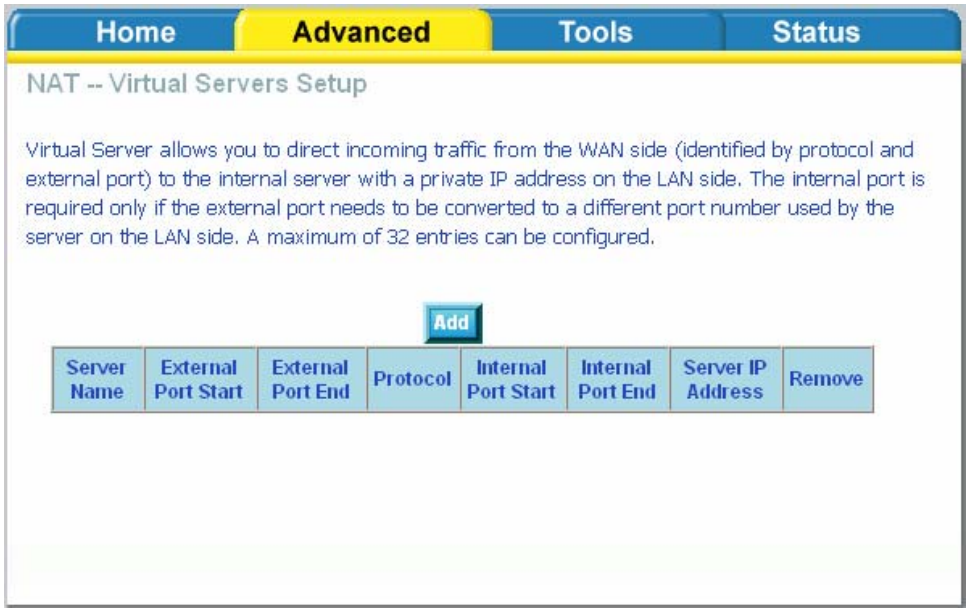
Virtual Server

If you enable NAT (Network Address Translation), you can configure the Virtual Server, Port Triggering, and DMZ Host.

NAT—Virtual Servers Setup

A virtual server allows you to direct incoming traffic from the WAN side to a specific IP address on the LAN side.

The following figure shows the screen that allows you to configure your virtual server(s). Click on the **Add** button to configure a virtual server.



Select the virtual server from the drop-down list and complete the server IP address, then click on **Apply** once.

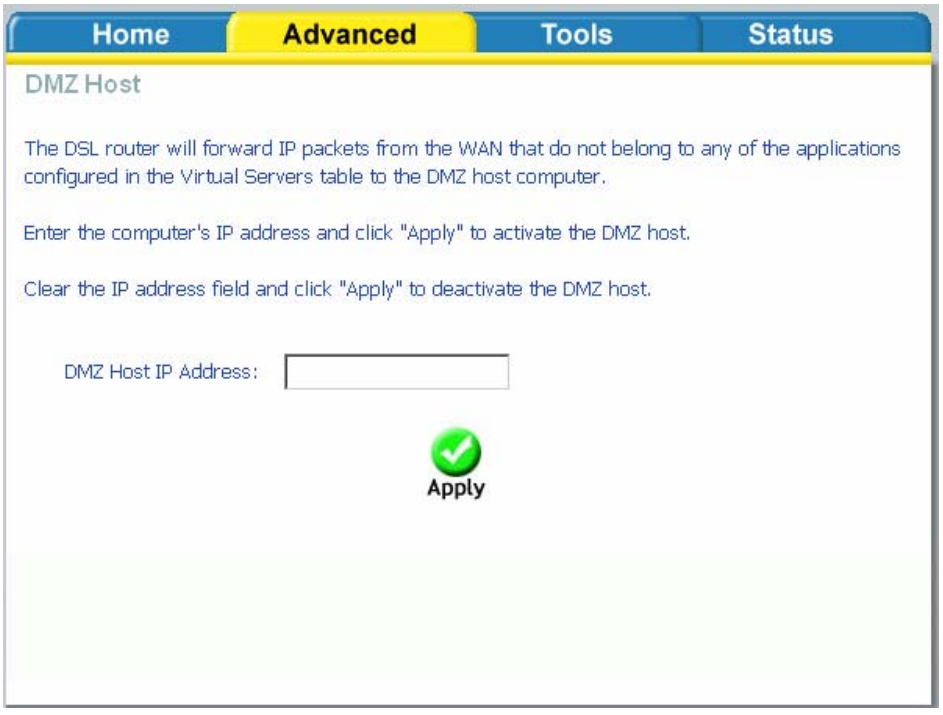
DMZ

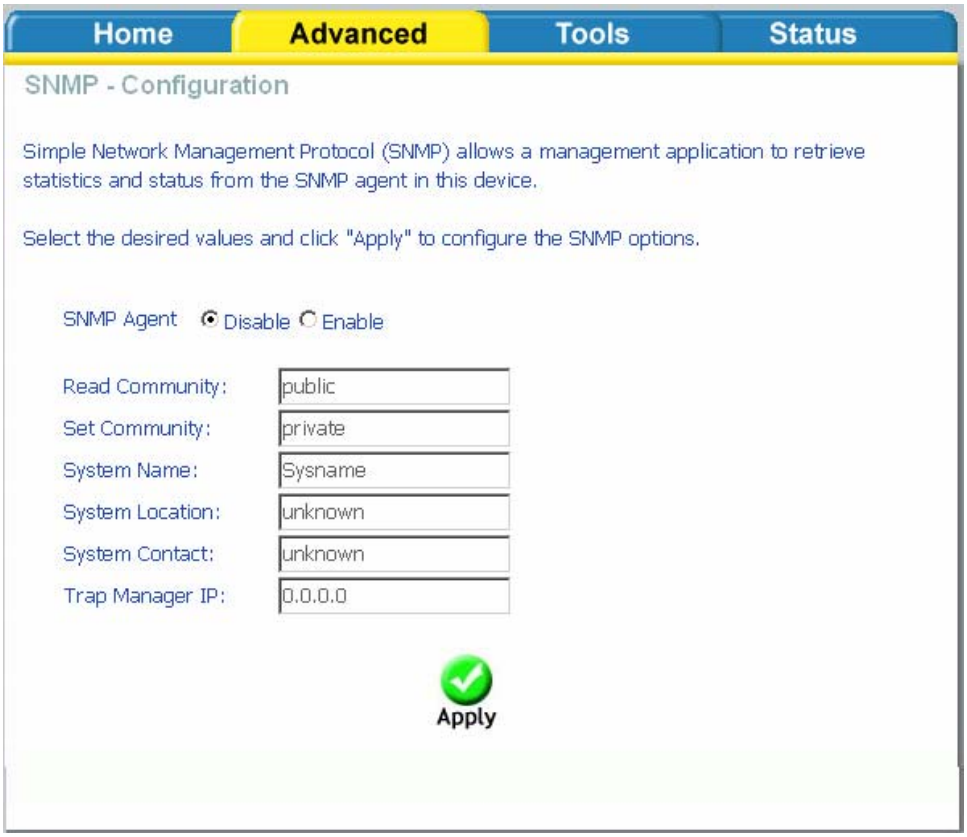
You can define the IP address of the DMZ Host on this screen. Enter the IP address and click on **Save / Apply**.



SNMP

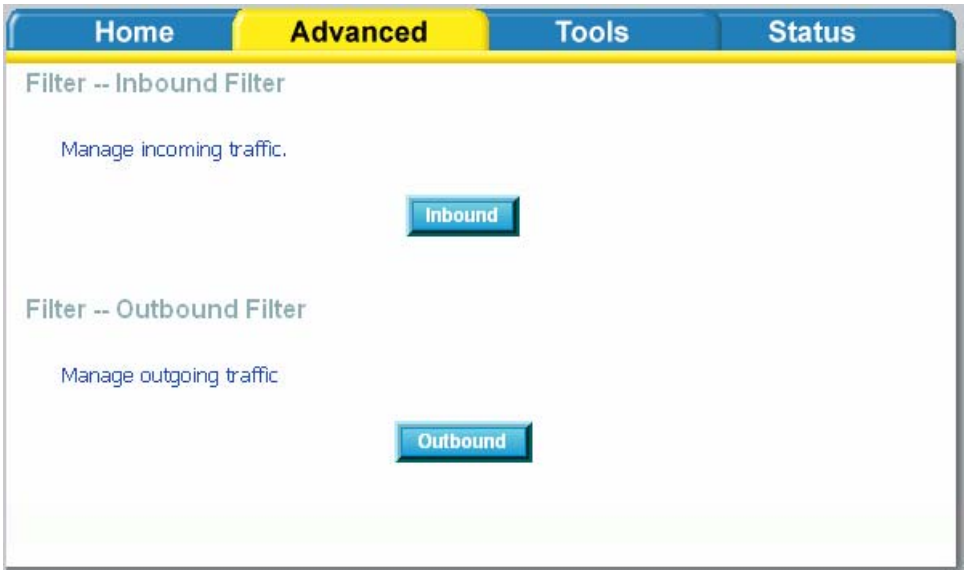
SNMP—Configuration

SNMP is Simple Network Management Protocol that provides a means to monitor status and performance as well as set configuration parameters. It enables a management station to configure, monitor and receive trap messages from network devices.



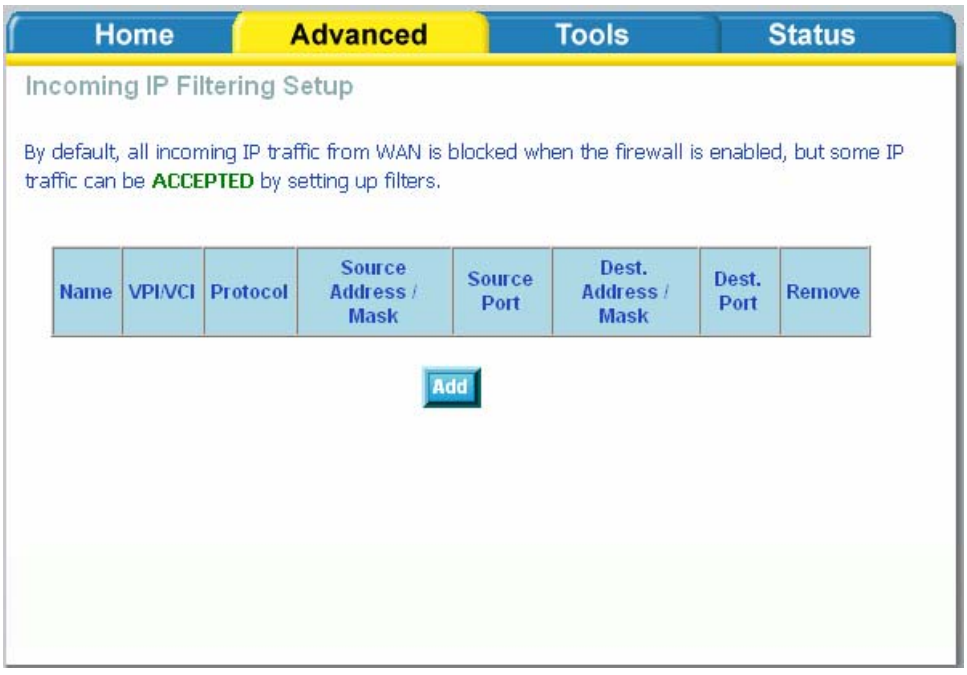
IP Filter

IP filters can be configured to manage your incoming and outgoing traffic. Click on the Inbound and Outbound buttons to advance to the next section for further configuration.

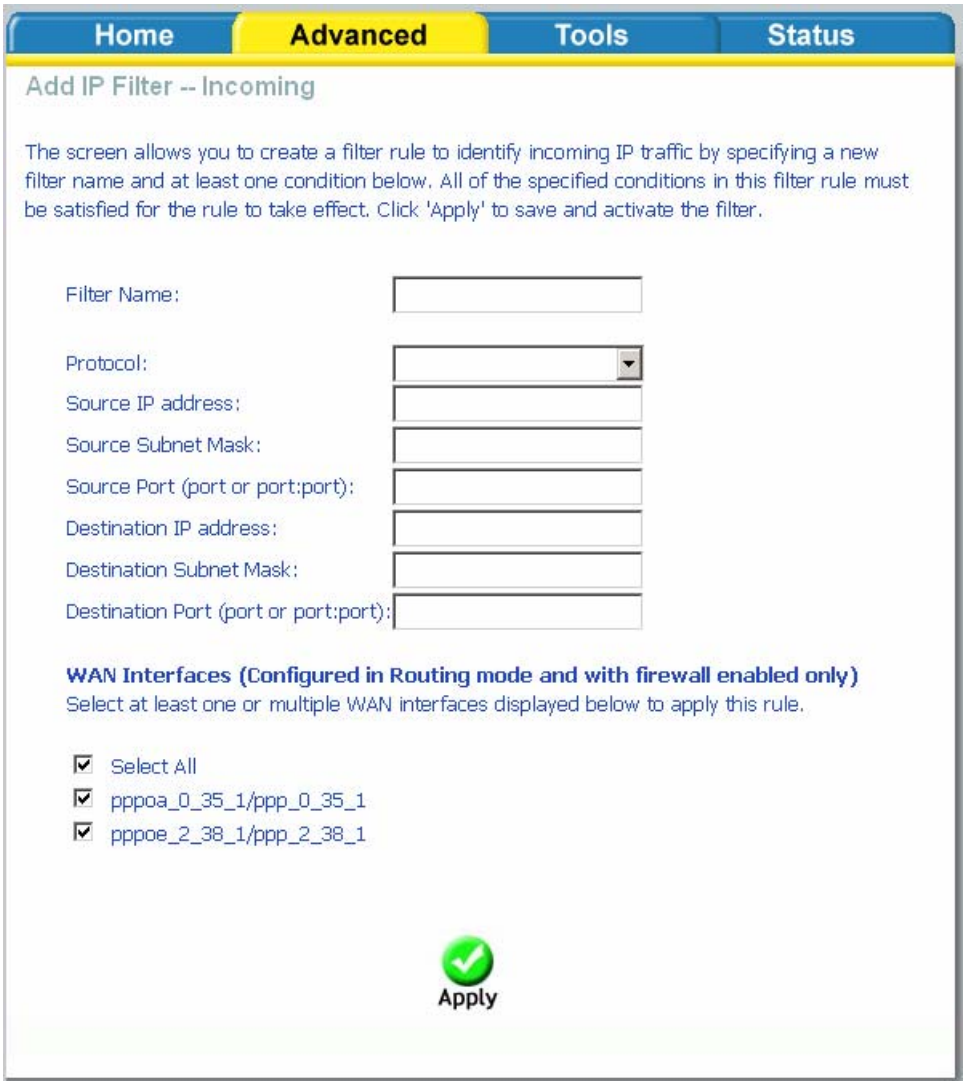


Incoming IP Filtering Setup

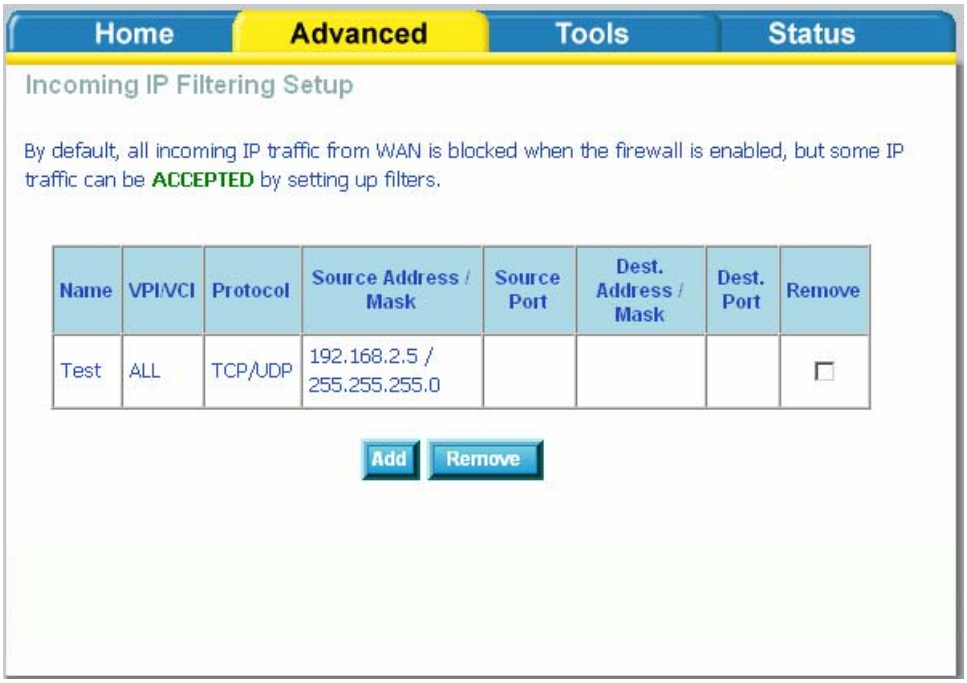
Incoming IP filter allows specified the WAN traffic to pass through the firewall. Click on the **Add** button to add incoming filter settings.



Enter a filter name, information about the source address (from the WAN side), and information about the destination address (to the LAN side). Select the protocol and WAN interface, then click on **Apply** to add the setting.

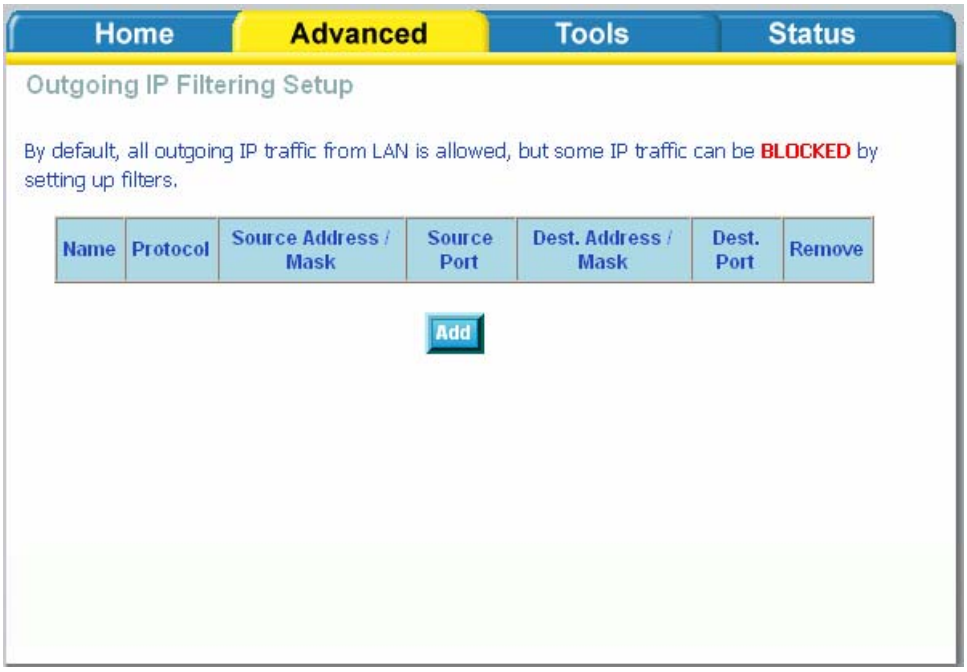


The following screen appears when you apply the IP filter. The screen lists the IP filters that were added from the previous screen. To change your settings, click on the **Add** or **Remove** buttons.

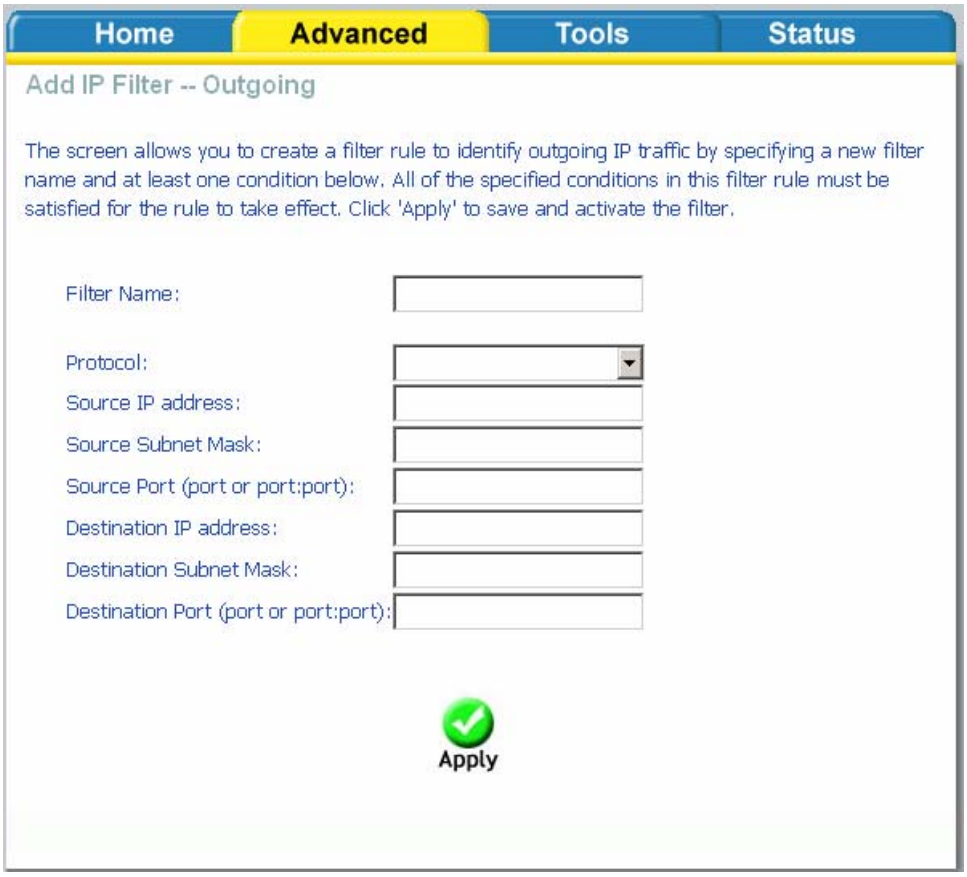


Outgoing IP Filtering Setup

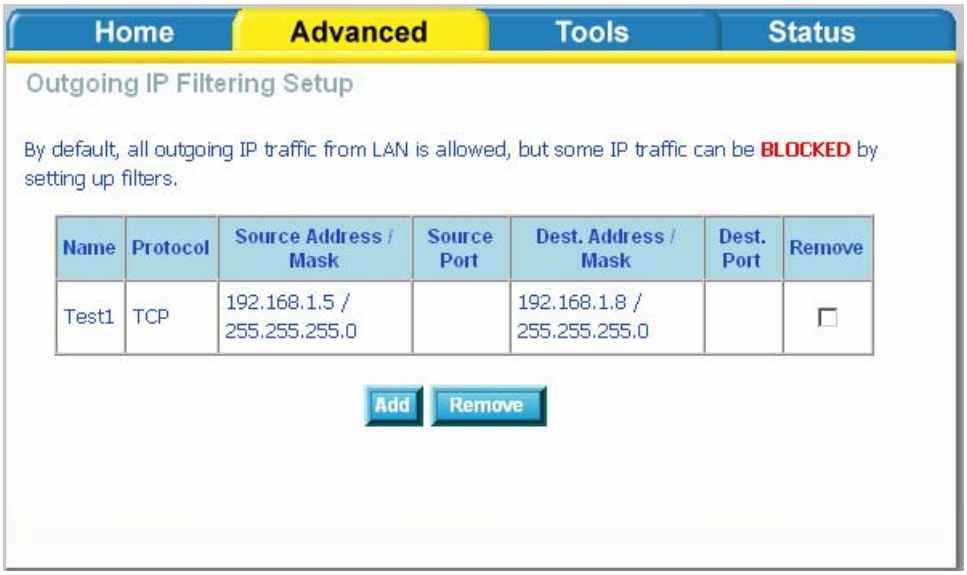
The outgoing filter will block the LAN traffic from entering the WAN side. Click on the **Add** button to create filters.



The below screen will appear when you click on **Add**. Input the filter name, source information (from the LAN side), and destination information (from the WAN side). Then click on **Apply** to save.



The following screen appears when you apply the IP filter. The screen lists the IP filters that were added from the previous screen. To change your settings, click on the **Add** or **Remove** buttons.

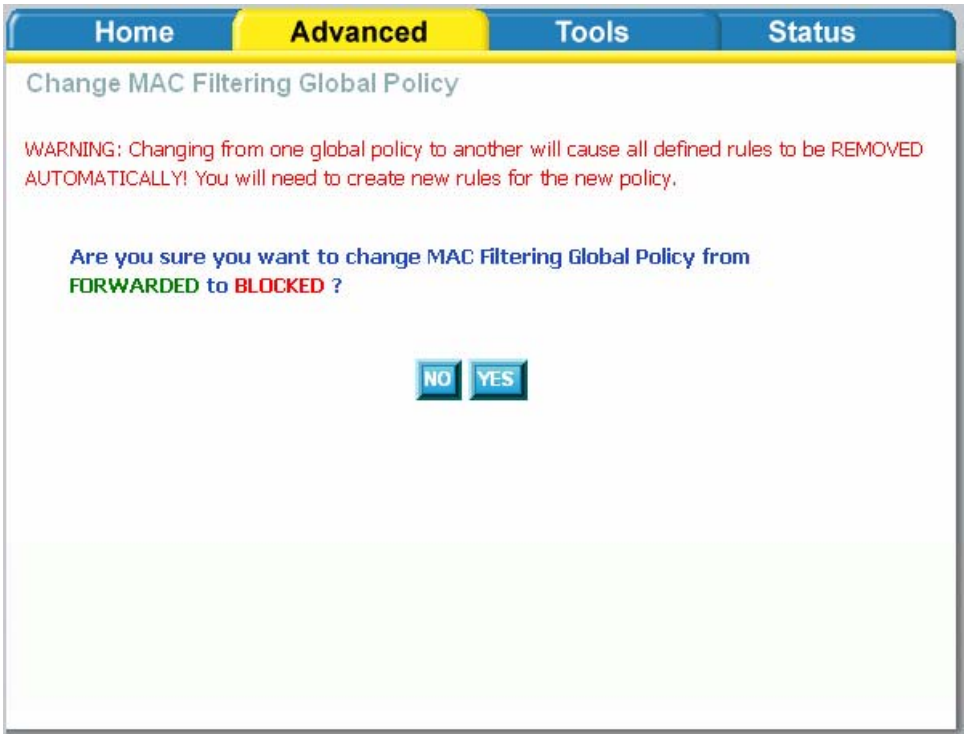


Bridge Filters

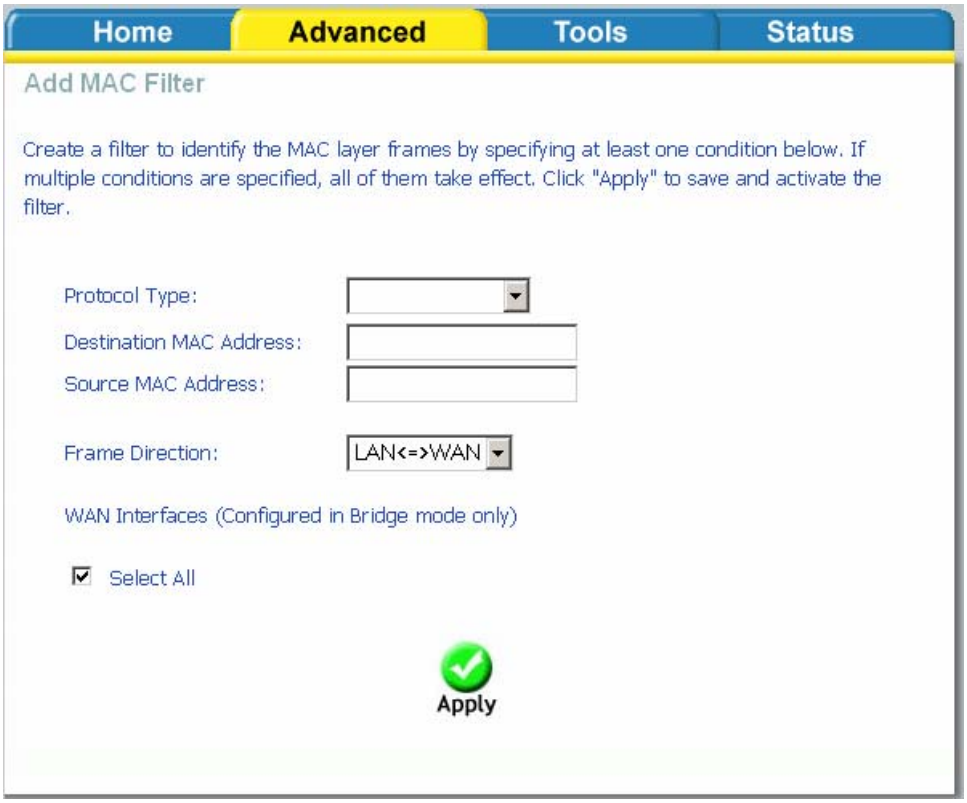
MAC Filtering Setup

MAC filtering can forward or block traffic by MAC address. You can change the policy or add settings to the MAC filtering table using the MAC Filtering Setup screen.

If you click on **Change Policy**, a confirmation dialog allows you to verify your change.



If you want to add a setting to the MAC filtering table, select protocol type, enter the destination and source MAC address, the necessary frame direction, and WAN interface (bridge mode only). Then click on **Apply** to save.



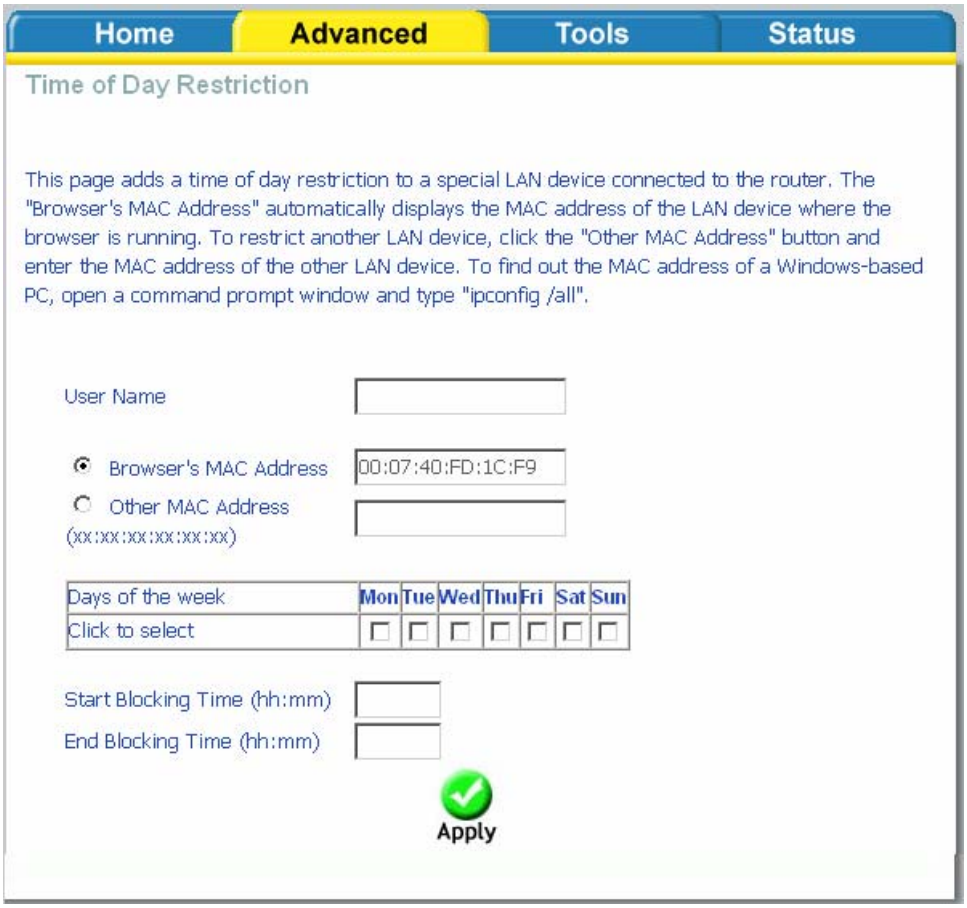
After you save the settings, a screen showing the settings will appear. On this screen you will be able to view and delete MAC filtering rules.

Parental Control

Time of Day Restrictions

In a home setting, parents can also restrict the day of the week certain computers can access the router. Click on **Add** to set up the restrictions.

After you click you **Add**, you will see the below screen. You will be able to enter the MAC address of the PC that you wish to place on a time of day restriction. Click on **Save / Apply** to save the settings and to continue.



Home
Advanced
Tools
Status
Time of Day Restriction
This page adds a time of day restriction to a special LAN device connected to the router. The "Browser's MAC Address" automatically displays the MAC address of the LAN device where the browser is running. To restrict another LAN device, click the "Other MAC Address" button and enter the MAC address of the other LAN device. To find out the MAC address of a Windows-based PC, open a command prompt window and type "ipconfig /all".

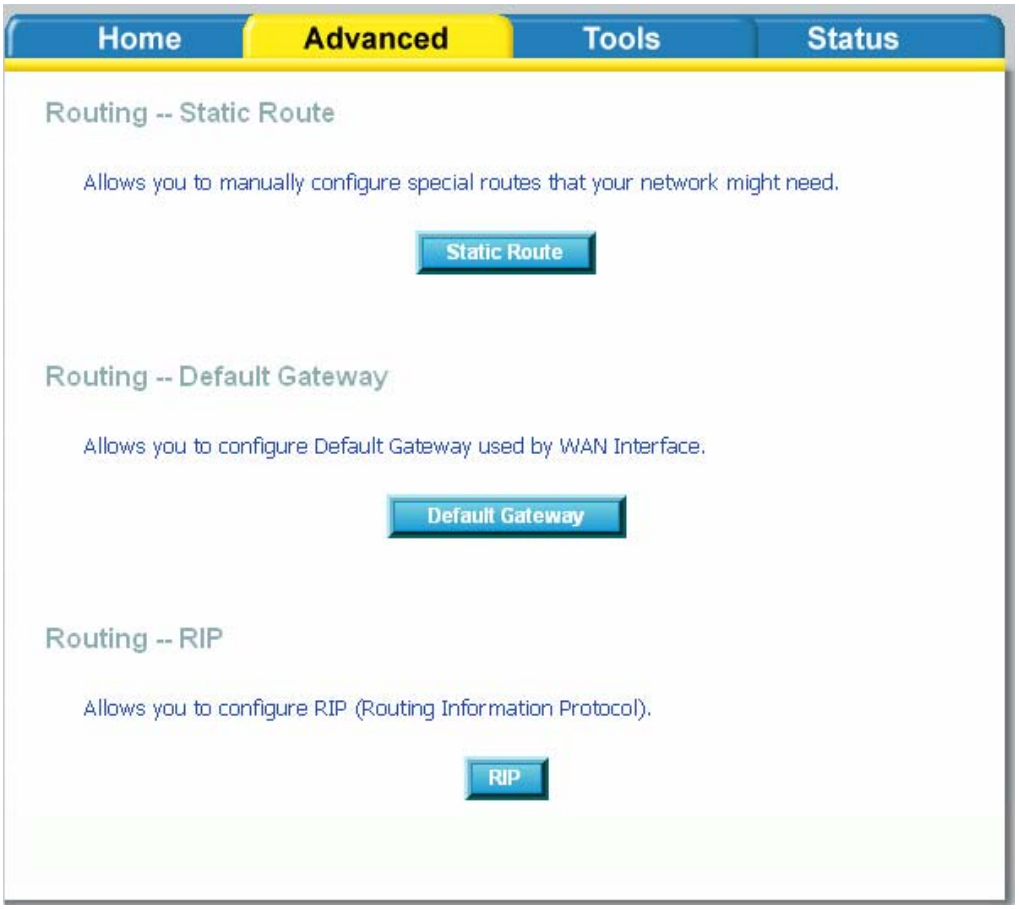
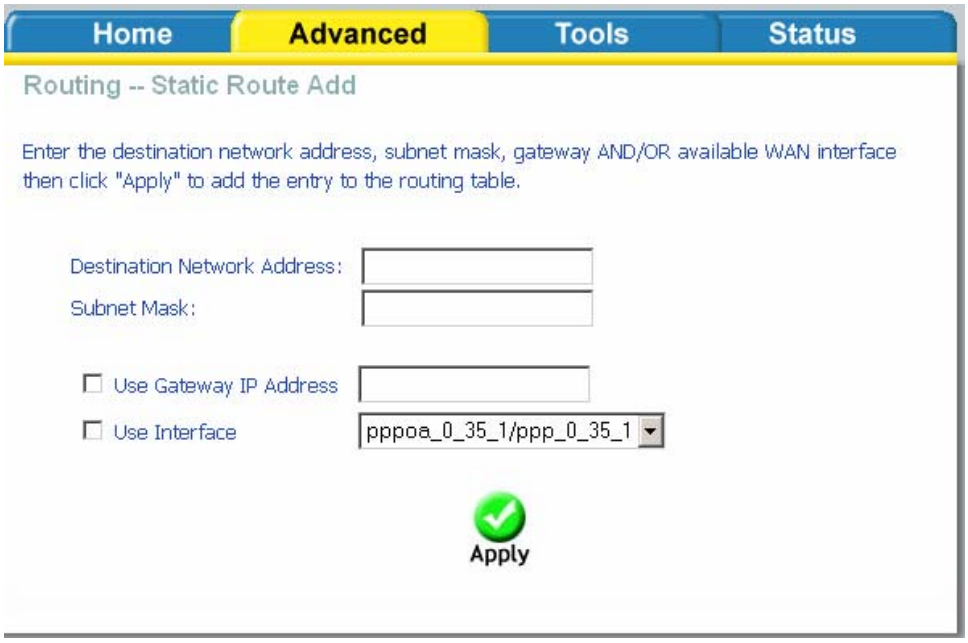
Routing



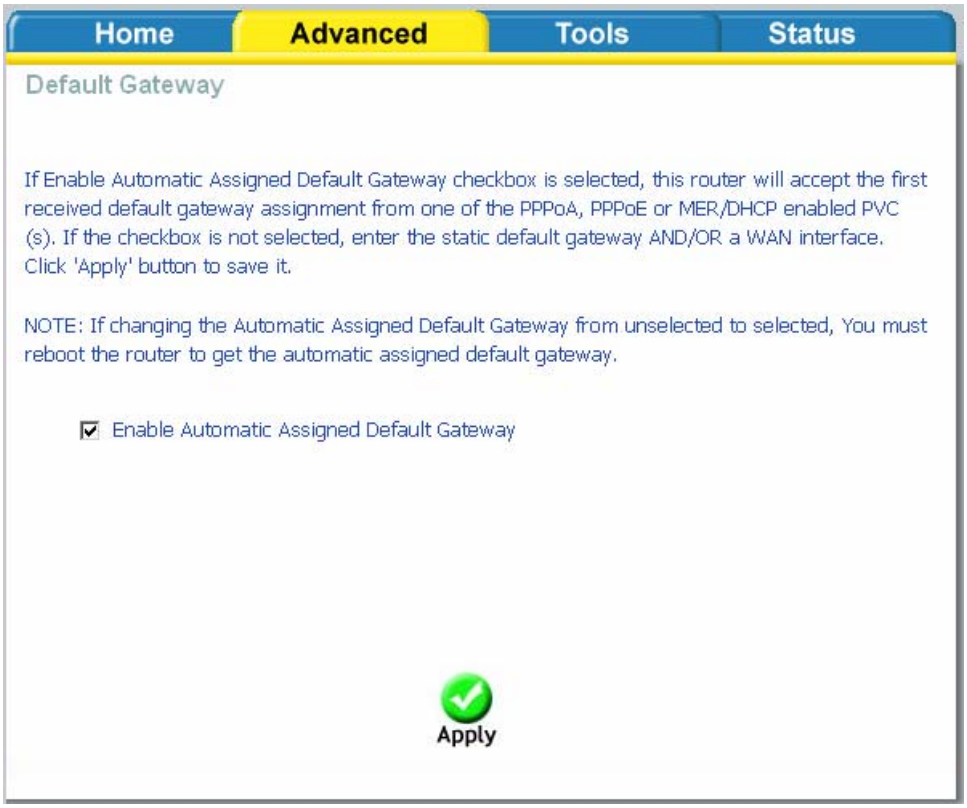
Routing--Static Route

The Static Route page can be used to add a routing table (a maximum of 32 entries can be configured). To proceed, click on **Add**.

Enter the route information and then apply your configurations.

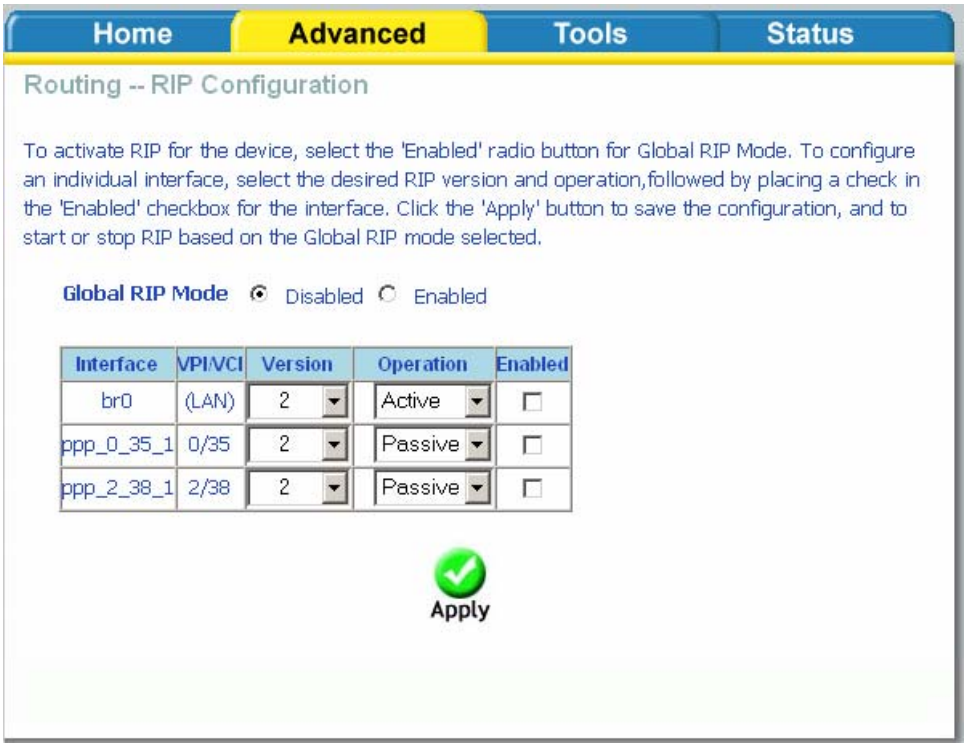


Routing—Default Gateway



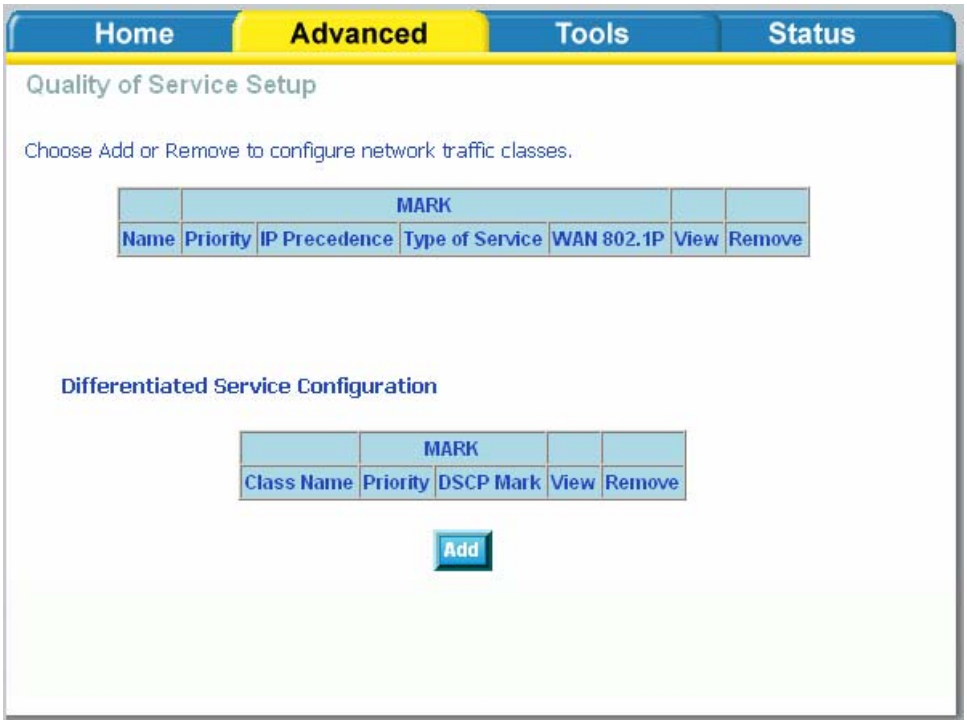
Routing—RIP Configuration

If RIP is enabled, the router operation can be configured as active or passive.

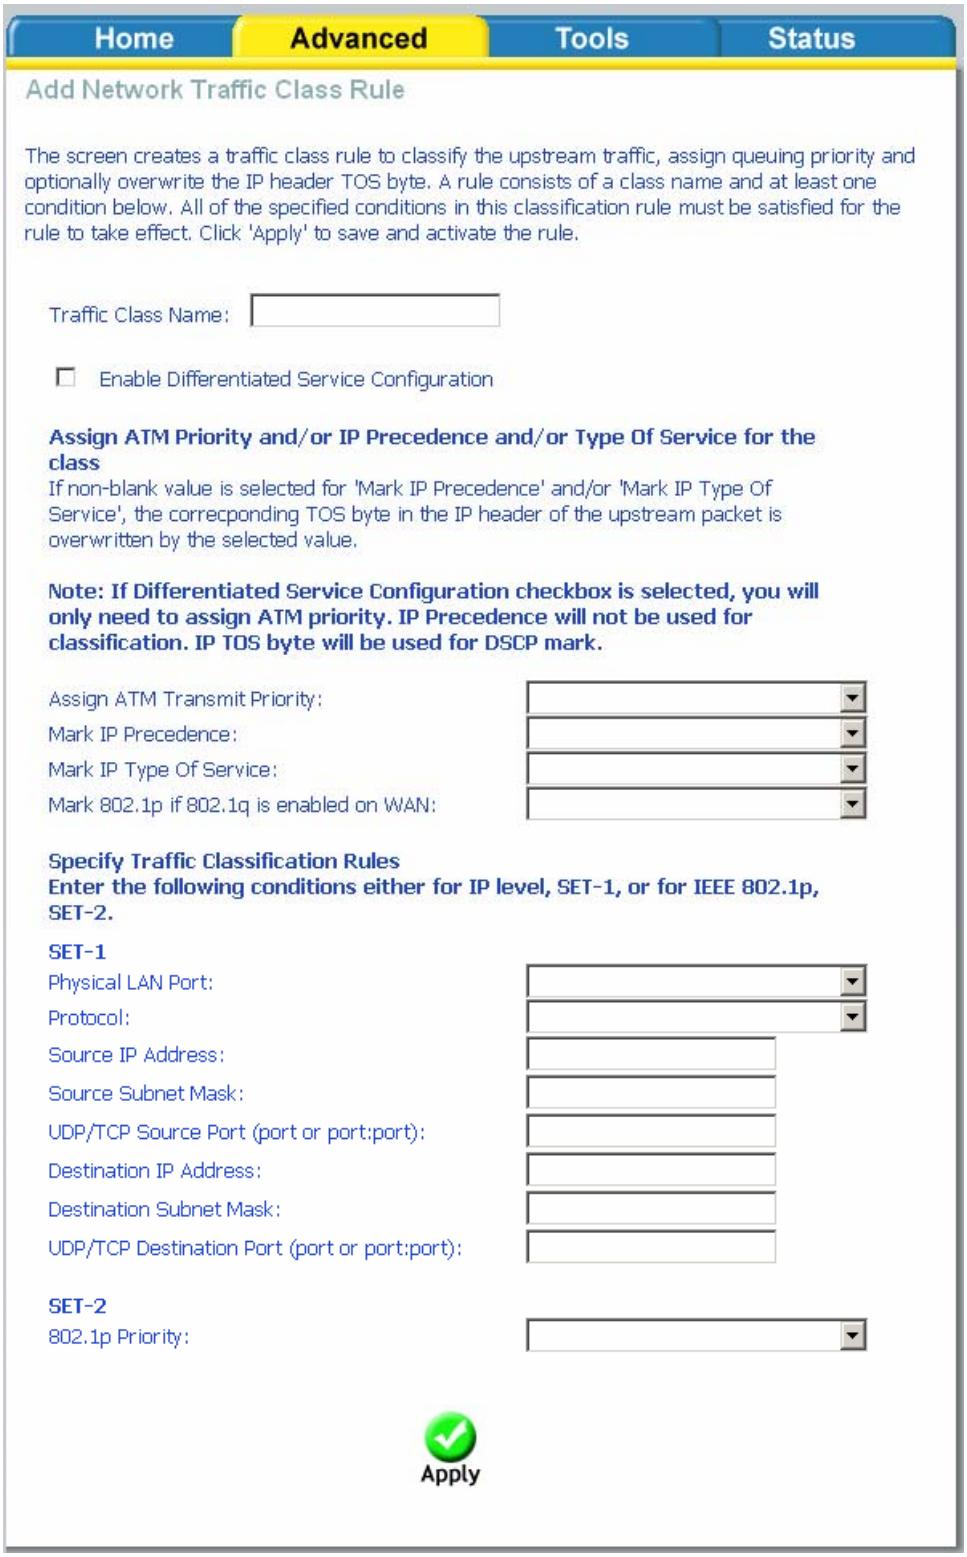


Quality of Service

You can configure the Quality of Service to apply different priorities to traffic on the router. Click on **Add** to view the *Add Network Traffic Class Rule* screen.



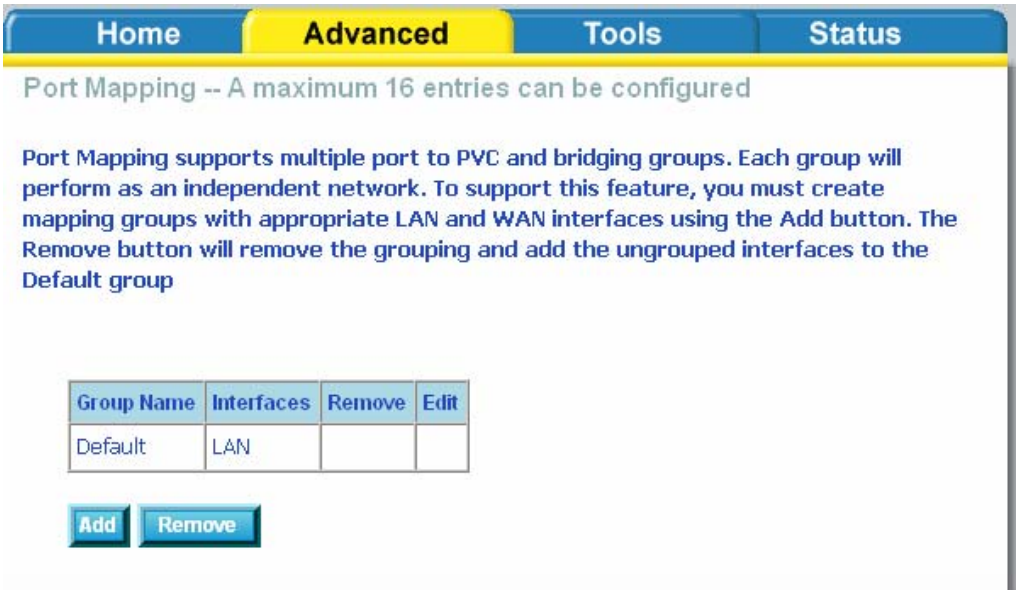
This screen allows you to add a network traffic class rule.



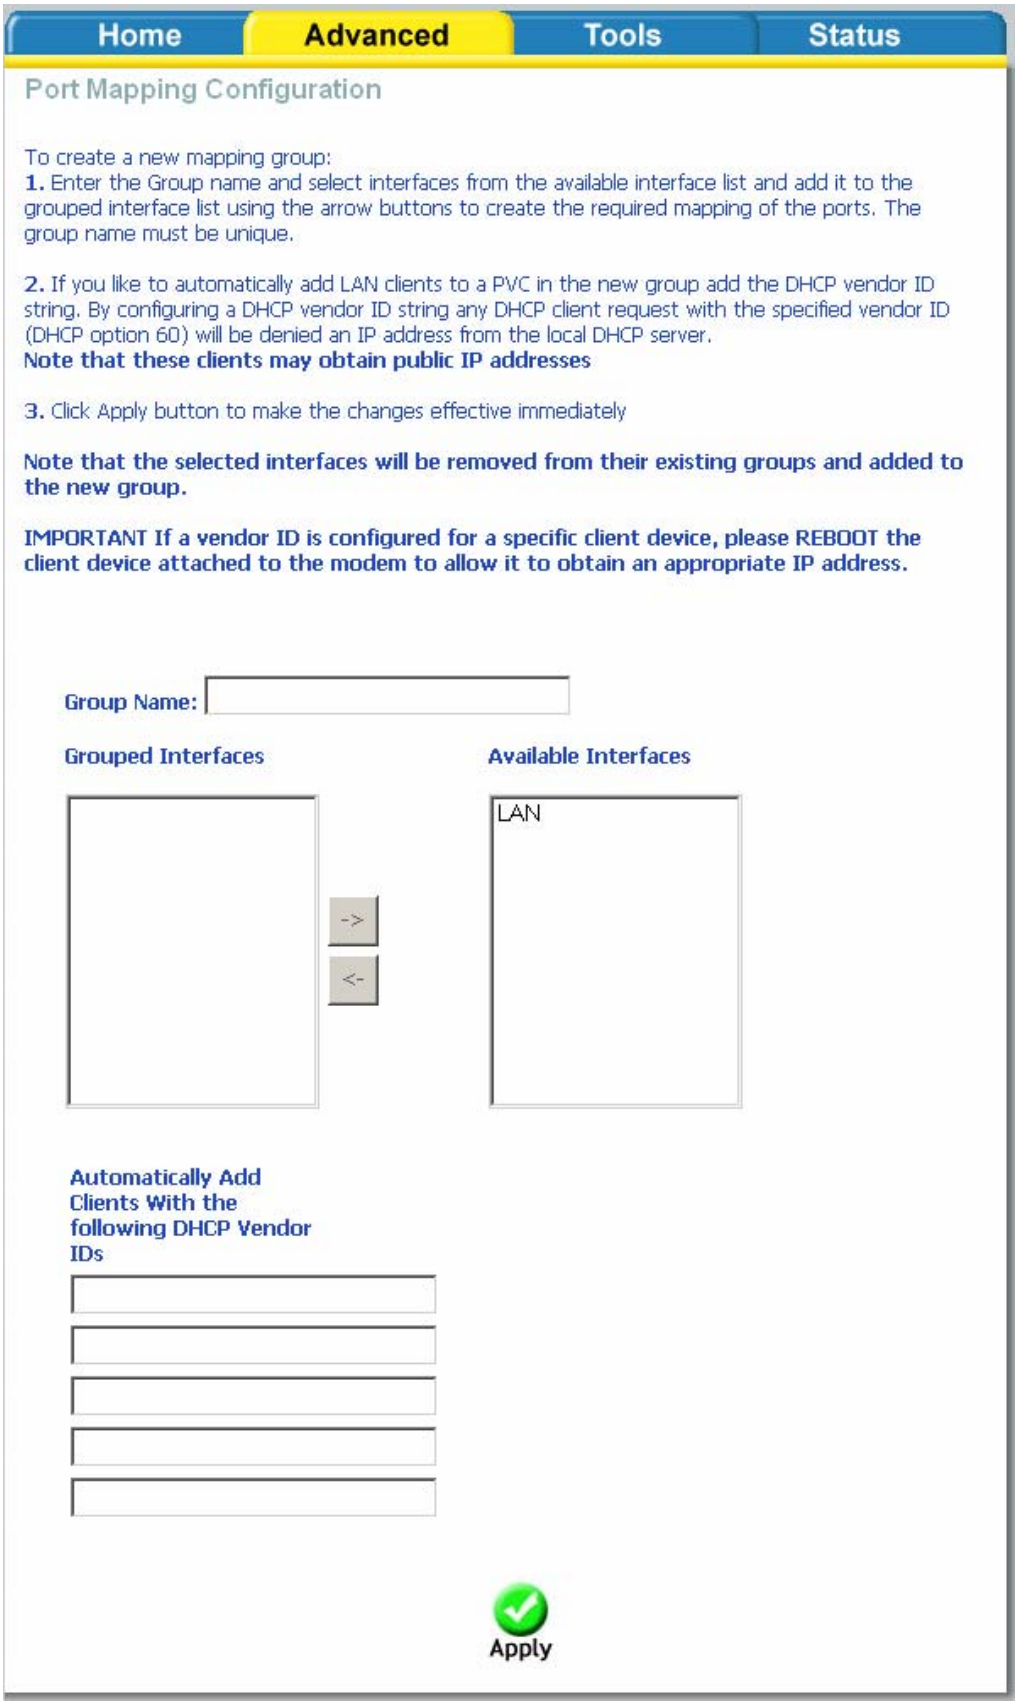
Port Mapping

Port mapping is a feature that allows you to open ports to allow certain Internet applications on the WAN side to pass through the firewall and enter your LAN. To use this feature, mapping groups should be created.

Click on the **Add** button as displayed below. If you need to remove an entry, then click on the **Remove** button.



After clicking the **Add** button, the below configuration screen appears, allowing you enter the groups and the interfaces they are associated with.



Home
Advanced
Tools
Status
Port Mapping Configuration
To create a new mapping group:
1. Enter the Group name and select interfaces from the available interface list and add it to the grouped interface list using the arrow buttons to create the required mapping of the ports. The group name must be unique.
2. If you like to automatically add LAN clients to a PVC in the new group add the DHCP vendor ID string. By configuring a DHCP vendor ID string any DHCP client request with the specified vendor ID (DHCP option 60) will be denied an IP address from the local DHCP server.
Note that these clients may obtain public IP addresses
3. Click Apply button to make the changes effective immediately
Note that the selected interfaces will be removed from their existing groups and added to the new group.
IMPORTANT If a vendor ID is configured for a specific client device, please REBOOT the client device attached to the modem to allow it to obtain an appropriate IP address.

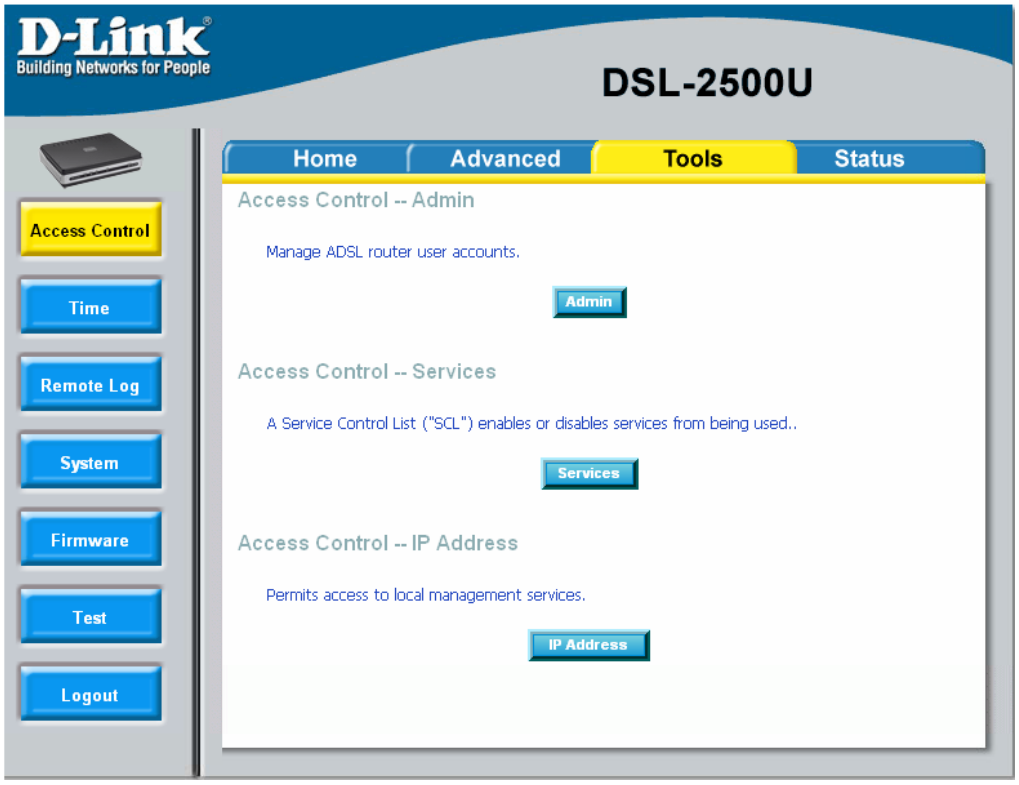
Tools

The tools section contains various administrator functions to maintain your router. Sections include the following—Admin, Time, Remote Log, System, Firmware, and Test.

- **Admin**: Allows you to change the password for the various user names available
- **Time**: Allows you to set the router's time
- **Remote Log**: Allows you to view logs of the router's activities
- **System**: Allows you to perform functions such as save / reboot, backup, update settings, and restore default settings
- **Firmware**: Allows you to upgrade your router with new available firmware versions
- **Test**: Allows you to view test information for your Internet connection

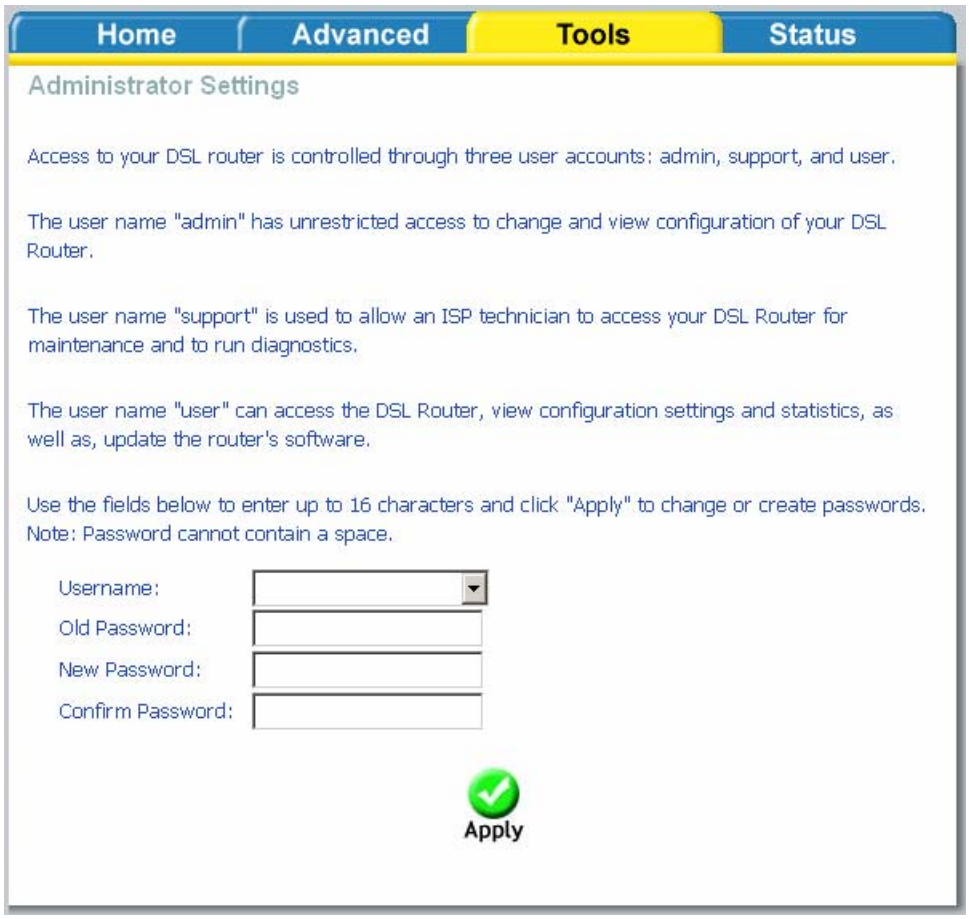
Access Control

You can enable or disable some services of your router by LAN or WAN. If no WAN connection is defined, only the LAN side can be configured.



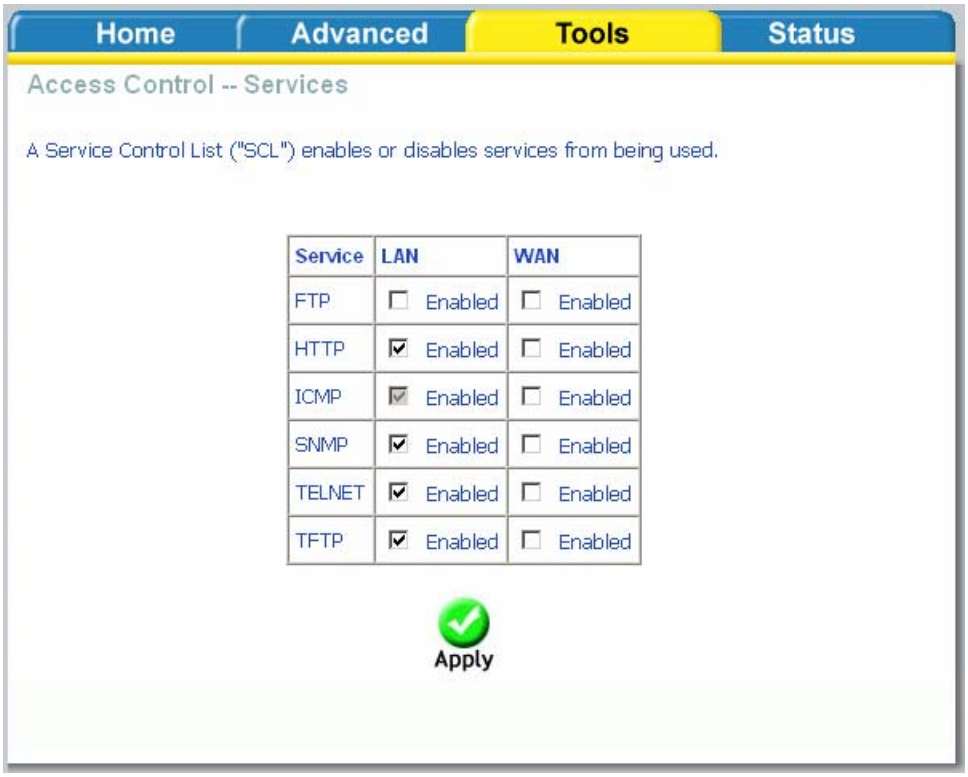
Access Control—Admin

Three user names and passwords—**admin**, **support**, and **user**—can be used to control your router. The passwords for these user names can be changed on the following screen. Enter the user name followed by the old password and the new password that you wish to change to.



Access Control—Services

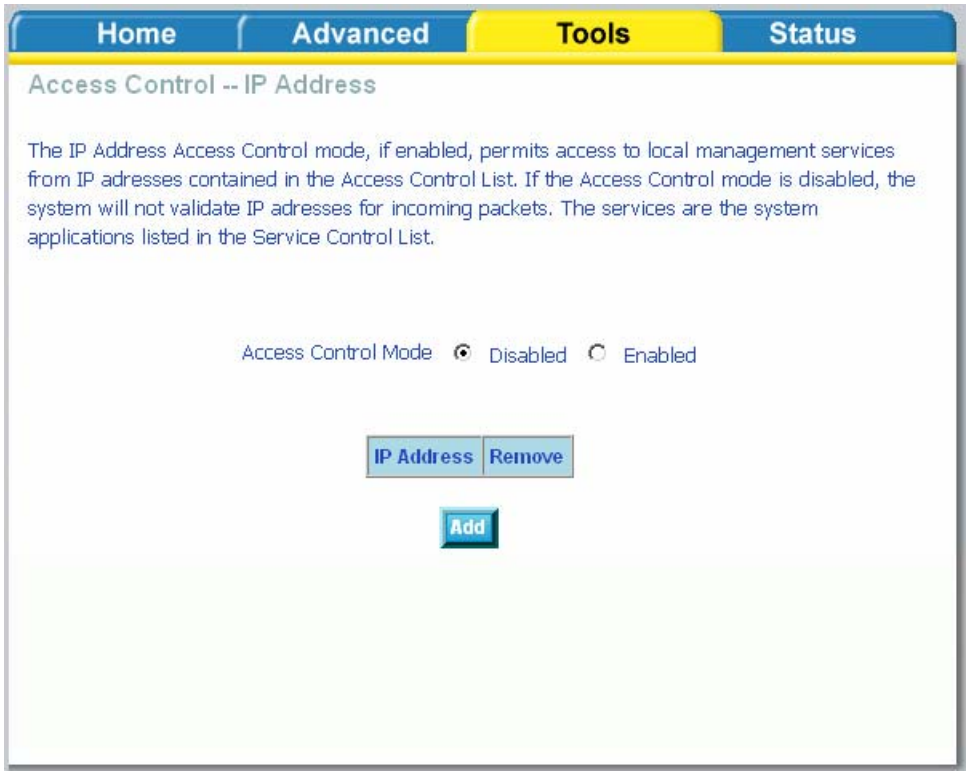
Services that can be enabled / disabled on the LAN / WAN are FTP, HTTP, ICMP, SNMP, Telnet, and TFTP.



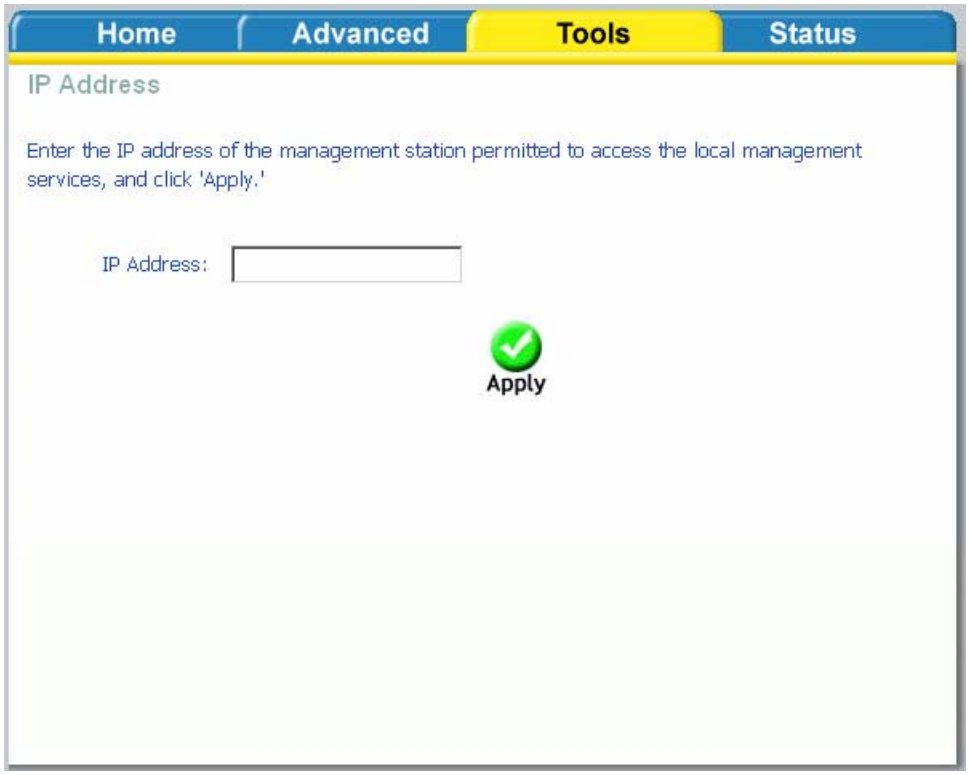
Access Control—IP Address

Web access to the router can be limited when Access Control Mode is enabled. The IP addresses of allowed hosts can be added using Access Control→IP Address.

Add the IP address to the IP address list by clicking on the **Add** button, then select "**Enabled**" to enable Access Control Mode.

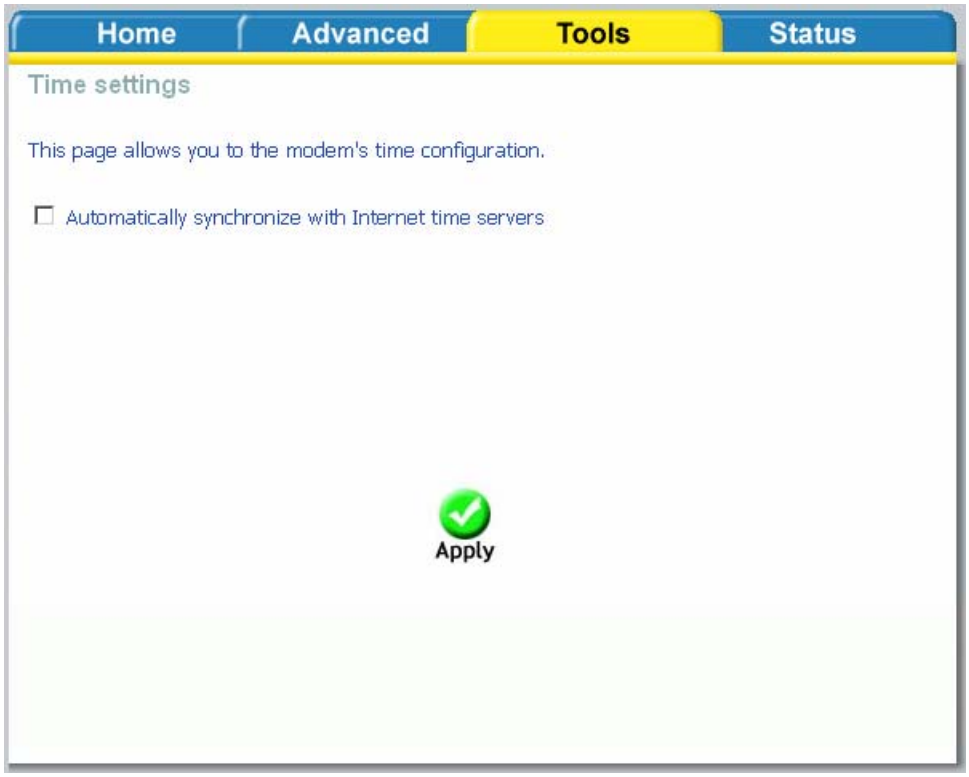


To assign the IP address of the management station that is permitted to access the local management services, enter the IP address in the box and click on the **Apply** button.

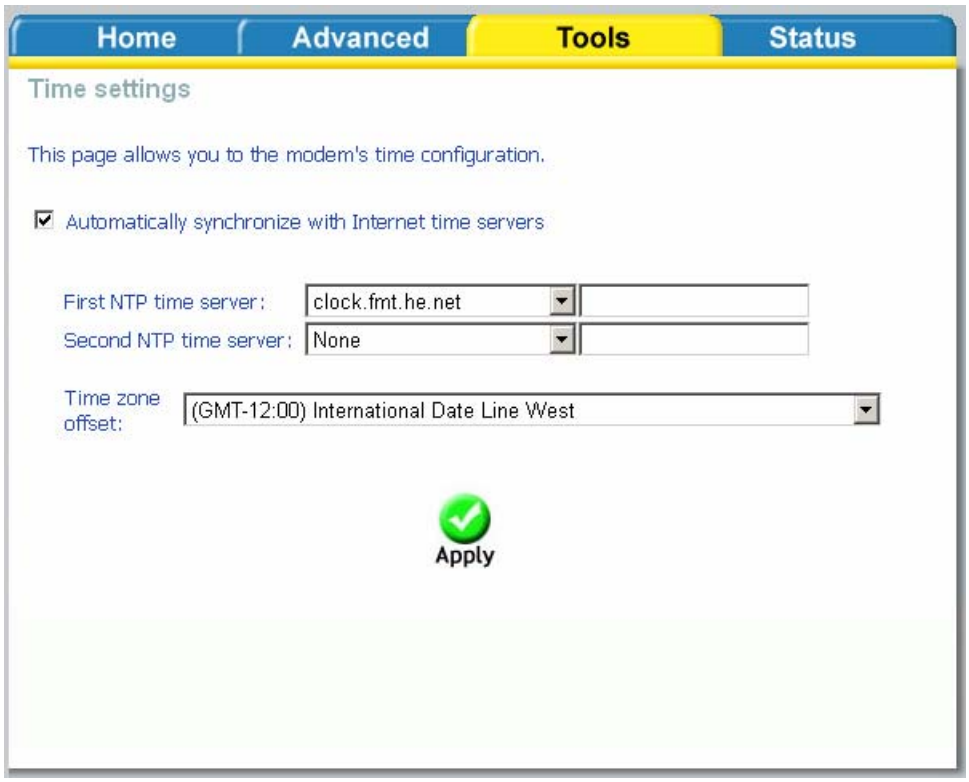


Time

The Time Settings page allows you to automatically synchronize your time with a time server on the Internet.



If you choose to set the router's time, click on the "automatically synchronize with Internet time servers" checkbox and the below fields appear.



Select from the list of NTP (Network Time Protocol) time servers. Then select the time zone that you are in and click on **Apply** to save.

Remote Log

The Log dialog allows you to view and configure the log. To view the log, click on the **View System Log** button.

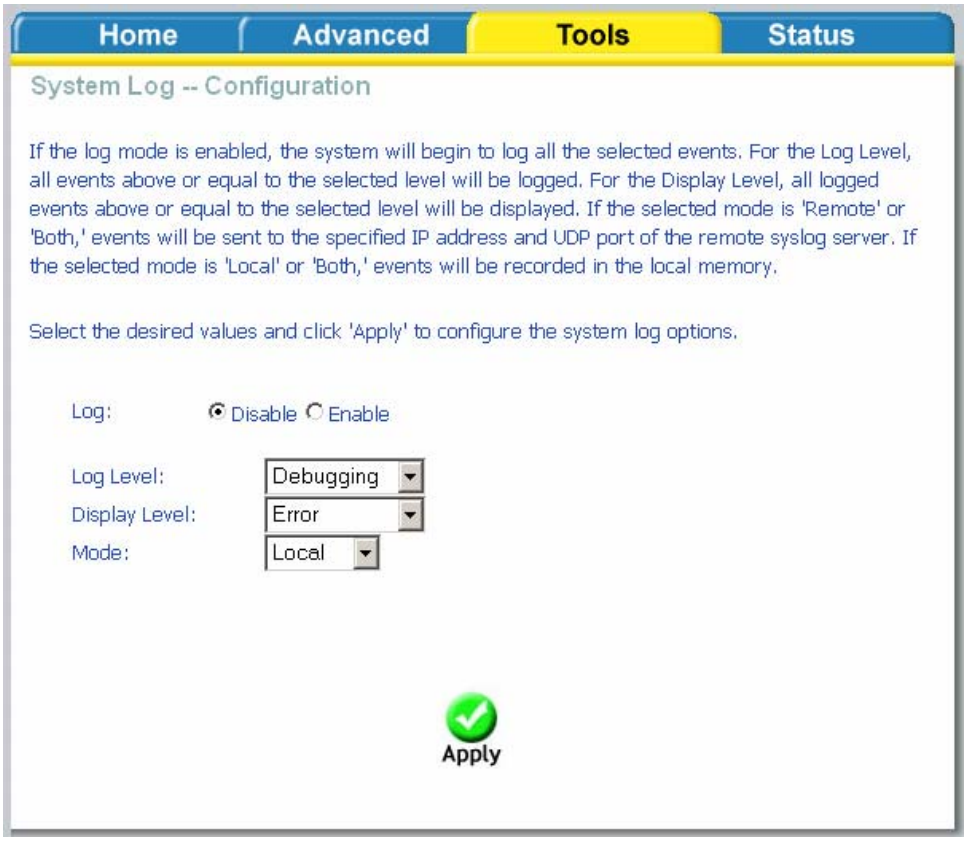
Below is the **System Log** screen which shows the date/time of the log, the facility that was logged, the severity level and the log message. Click on **Refresh** to view any new information that is logged.

System Log when log mode is DISABLED →

System Log when log mode is ENABLED →

NOTE: When you click on the View System Log button, the System Log screen that you access will be located under the Status section (see screen on left). To return to the previous screen to configure system log, remember to click on the Tools tab (located on top row) first and then click on Remotelog.

To configure the system log settings, click on the **Configure System Log** button to view the following screen.



If the log is enabled, the system will log selected events including *Emergency, Alert, Critical, Error, Warning, Notice, Informational,* and *Debugging.* All events above or equal to the selected log level will be logged and displayed.

If the selected mode is "Remote" or "Both", events will be sent to the specified IP address and UDP port of a remote system log server. If the selected mode is "Local" or "Both", events will be recorded in the local memory. Select the desired values and click on **Apply** to configure the system log options.

System

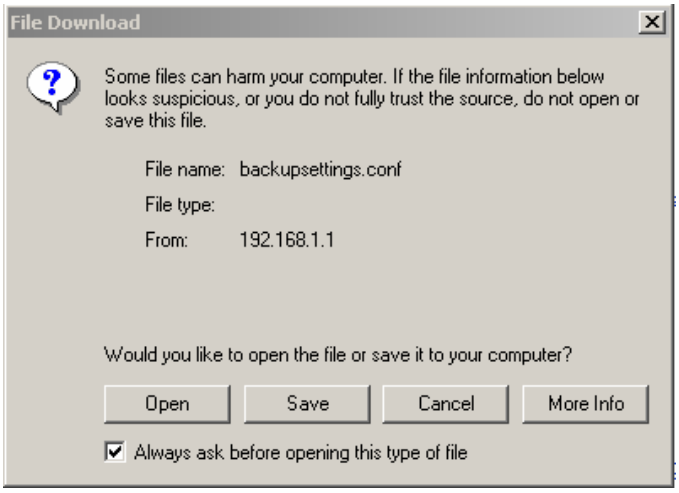
The system section includes several tools on one page, including save and reboot, backup settings, update settings, and restore default settings.

Save and Reboot

To save all configurations made, click on the **Save/Reboot** button. This will save all your settings and restart the router for the settings to take effect.

Backup Settings

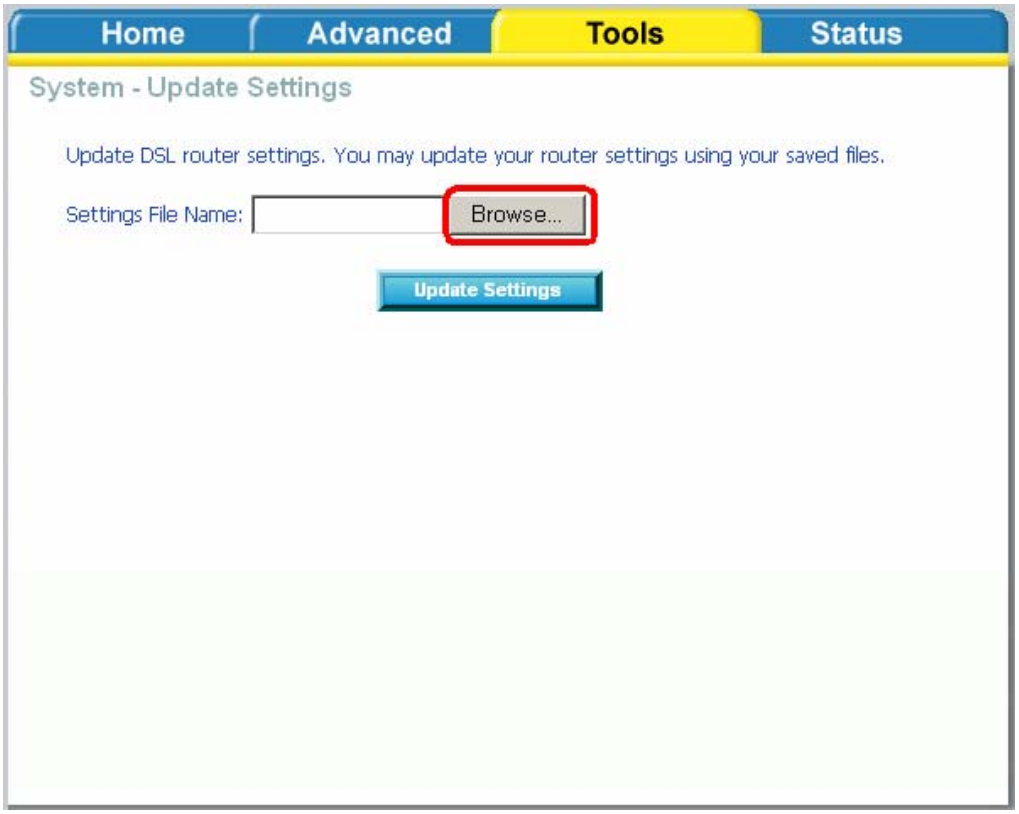
To save your configurations in a file on your computer so that it may be accessed again later if your current settings are changed, click on the **Backup Settings** button. The below pop-up screen will appear with a prompt to open or save the file to your computer.



File Download
Some files can harm your computer. If the file information below looks suspicious, or you do not fully trust the source, do not open or save this file.
File name: backupsettings.conf
File type:
From: 192.168.1.1
Would you like to open the file or save it to your computer?
Open
Save
Cancel
More Info
Always ask before opening this type of file

Update Settings

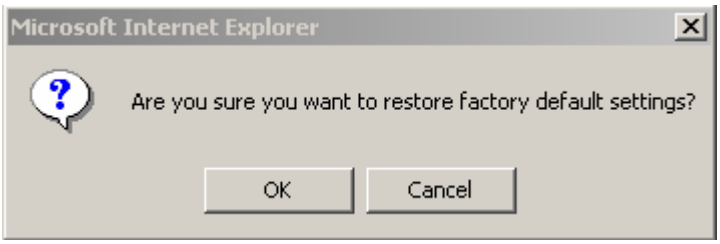
To load a previously saved configuration file onto your router, click **Browse** and select the file on your computer and then click on **Update Settings**.



The router will restore settings and reboot to activate the restored settings.

Restore Default Settings

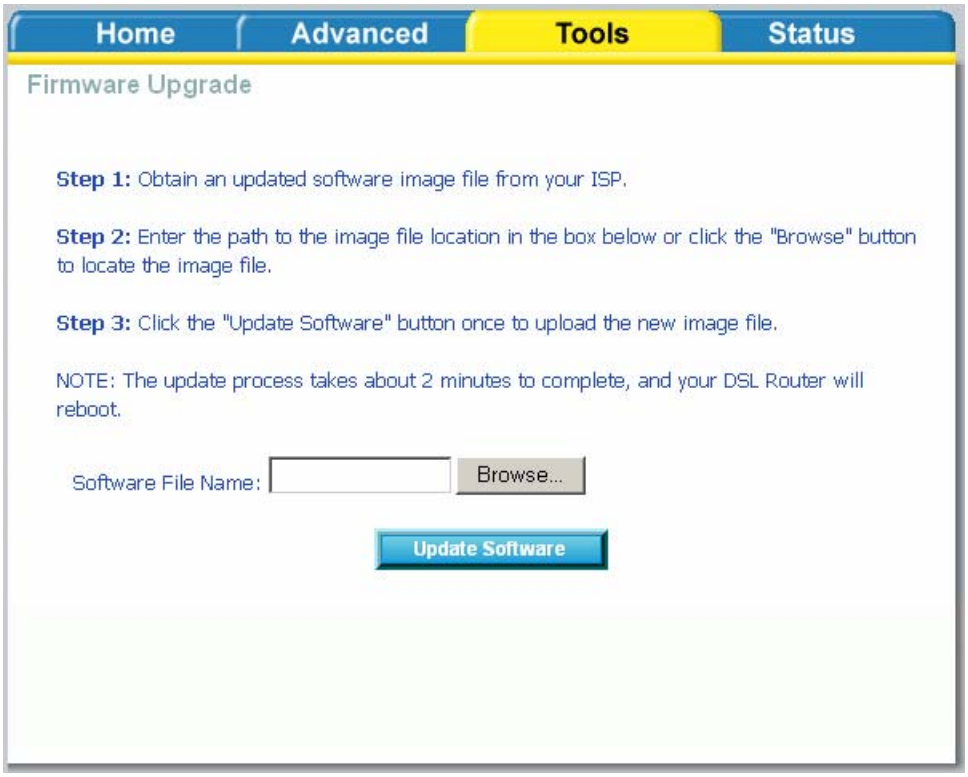
Restore Default will delete all current settings and restore the router to factory default settings. Click on the **Restore Default Settings** button to proceed. The following confirmation dialog will appear confirming your decision to restore default settings. Click on **OK** to continue.



Firmware

If your ISP releases new software for this router, follow these steps to perform an upgrade.

1. Obtain an updated software image file from your ISP.
2. Enter the path to the image file location or click on the **Browse** button to locate the image file.
3. Click the **Update Software** button once to upload the new image file.

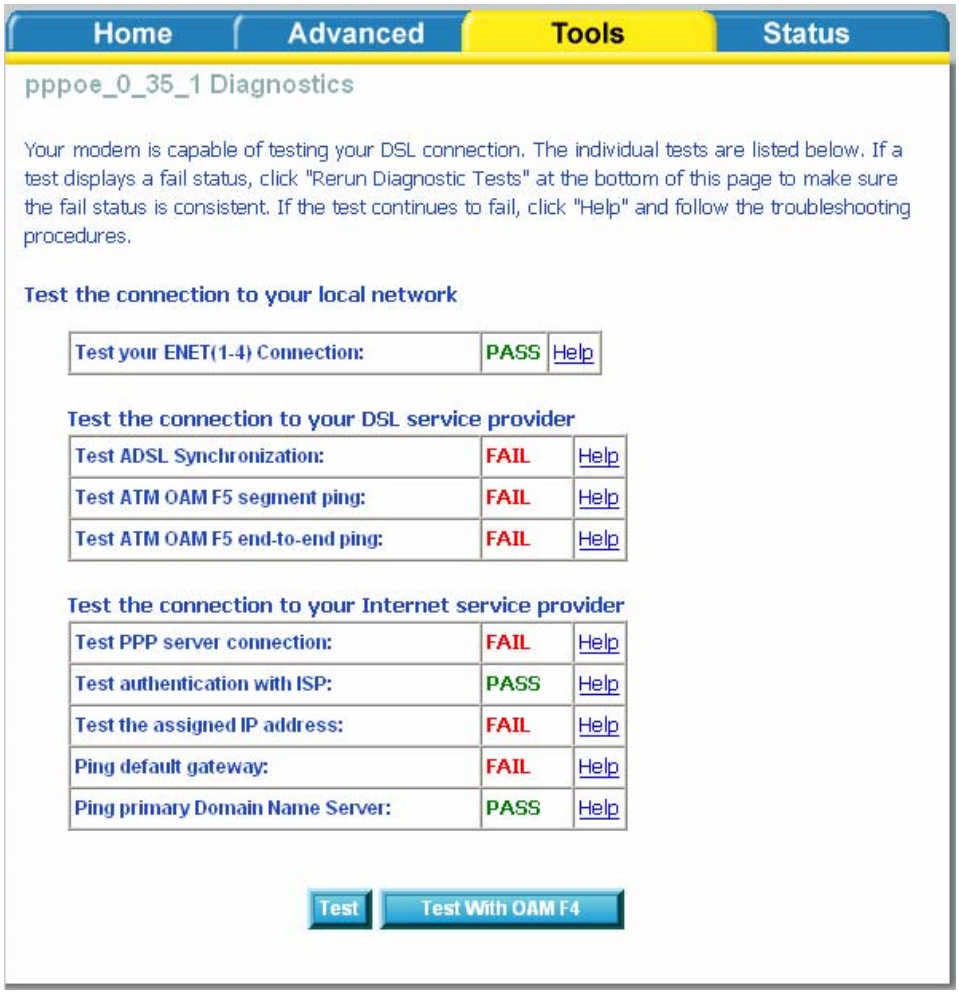


Test

The diagnostics screen allows you to run diagnostic tests to check your DSL connection. The results will show test results of three connections—

- Connection to your local network
- Connection to your DSL service provider
- Connection to your Internet service provider

There are three buttons at the bottom of the page—**Next Connection** (appears only if you have created more than one connection)**, Test** and **Test with OAM F4**—which will allow you to retest if necessary.

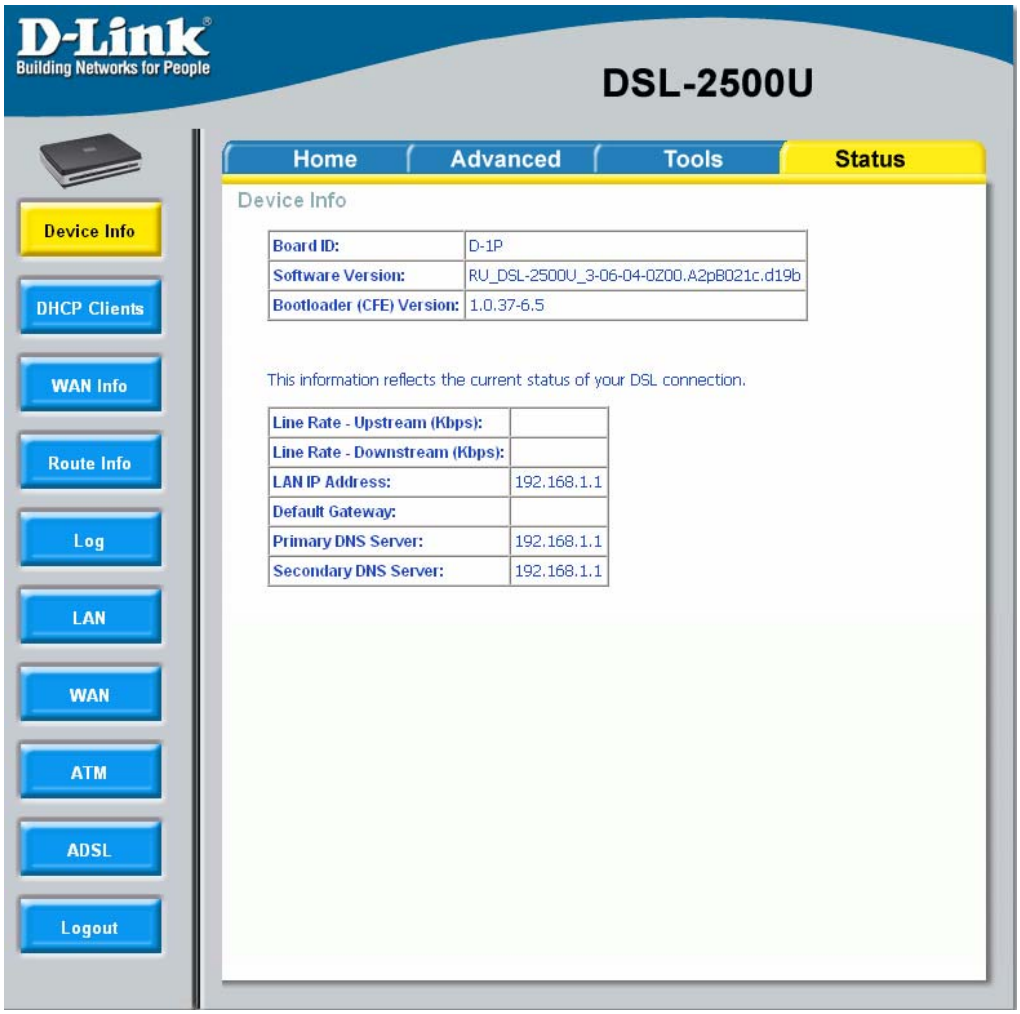


Status

The status section allows you to view general and status information for your router's connection.

Device Info

It shows details of the router such as the version of the software, bootloader, LAN IP address, etc. It also displays the current status of your DSL connection as shown below—

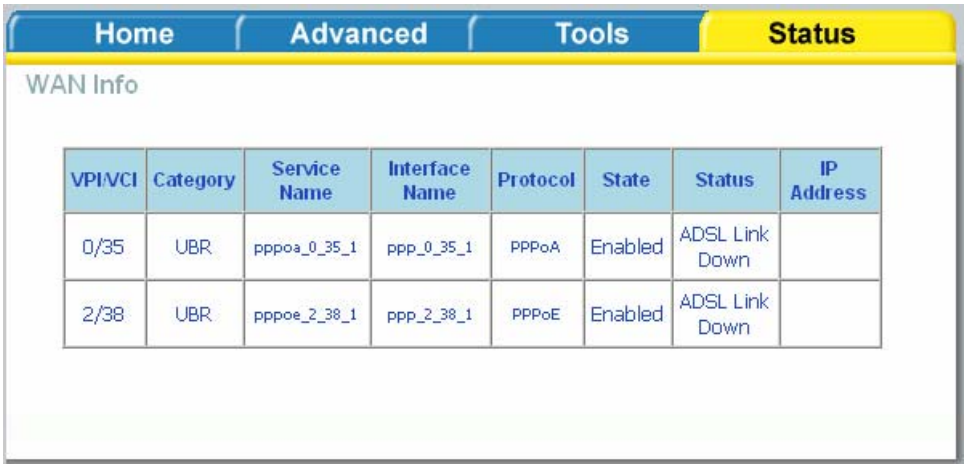


DHCP Clients

Access the DHCP Leases screen by clicking "**DHCP**" under "**Statistics**". This shows the computers, identified by the hostname and MAC address that have acquired IP addresses by the DHCP server with the time that the lease for the IP address is up.

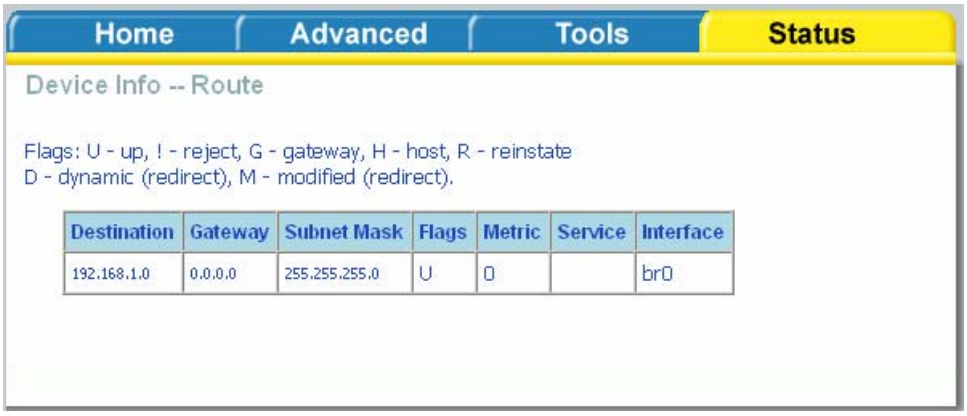
WAN Info

The WAN Info screen displays WAN connections previously set up in the Home section. The information added in the status section is the extra column for connection status information, displaying either *ADSL Link Down* or *ADSL Link Up*.



Route Info

The Route Info section displays route information showing the IP addresses of the destination, gateway, and subnet mask as well as other route information.

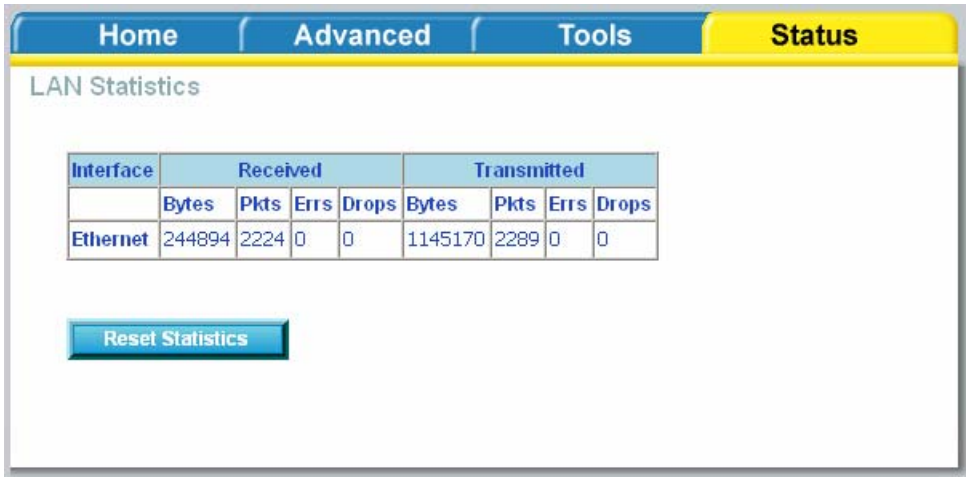


Log

This is the same screen as seen in the Remotelog section under tools.

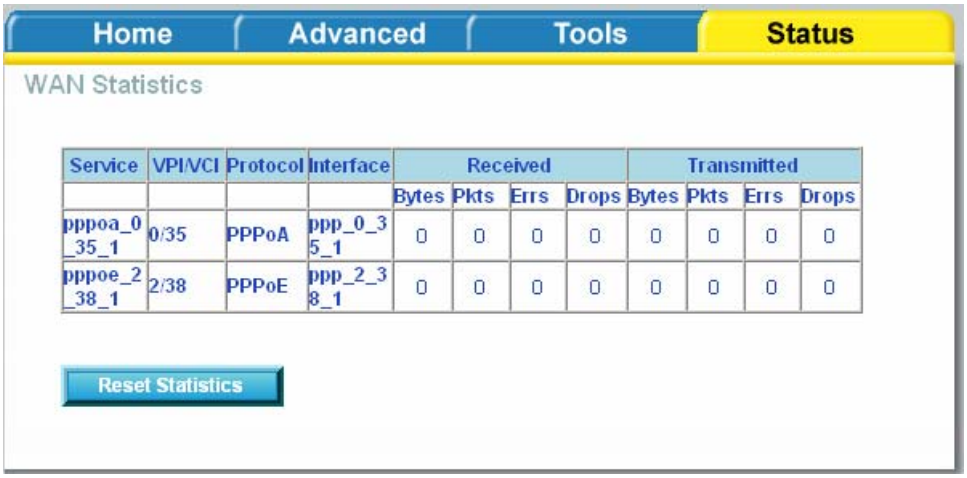
LAN

The LAN section shows received and transmitted packet information for the Ethernet interfaces. Click on **Reset Statistics** to renew the information.



WAN

The WAN section shows received and transmitted packet information for the WAN connections that you have set up. Click on **Reset Statistics** to renew the information.

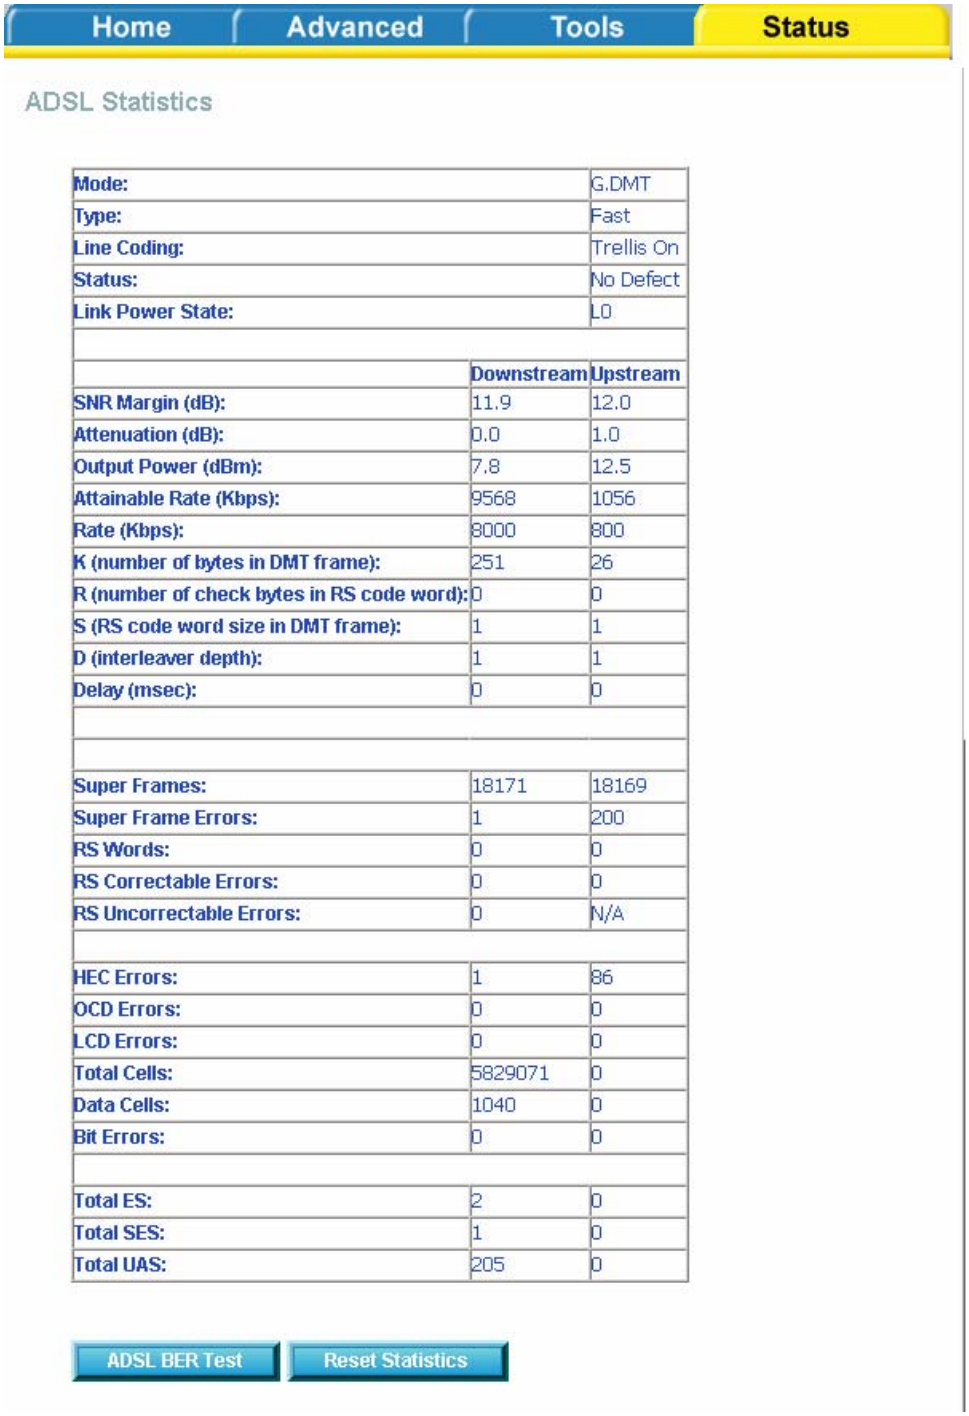


ATM

The ATM section displays statistical values for your ATM interface as well as for AAL5 and AAL5 VCC. Click on **Reset Statistics** to renew the values.

ADSL

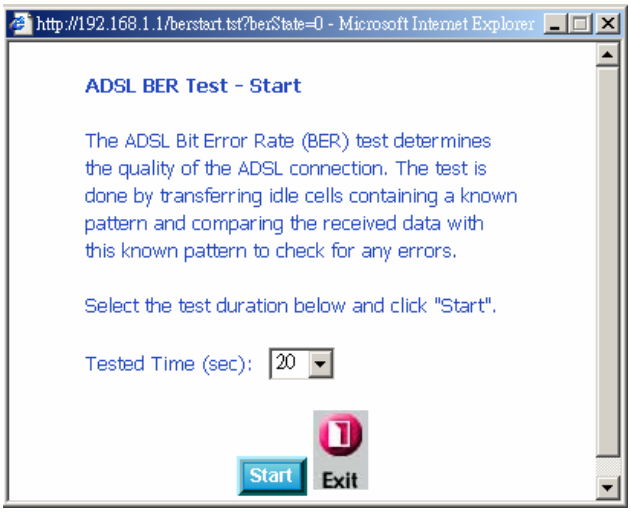
Information contained in the ADSL screen is useful for troubleshooting and diagnostics of connection problems.



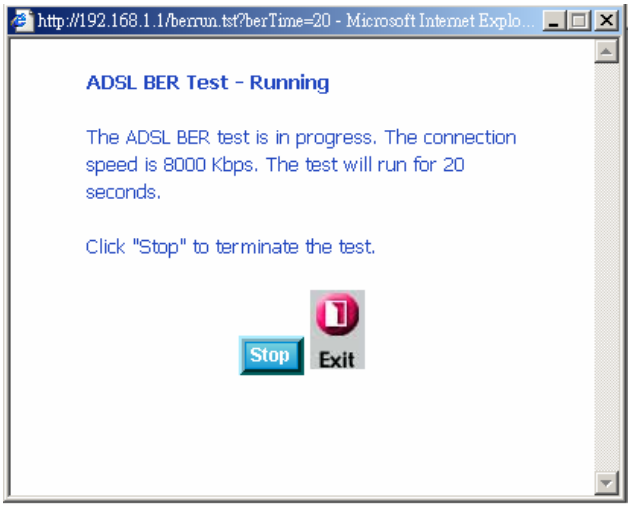
ADSL BER Test

A **Bit Error Rate Test (BER Test)** is a test that reflects the ratio of error bits to the total number transmitted.

If you click on the **ADSL BER Test** button at the bottom of the ADSL Statistics page, the following pop-up screen will appear allowing you to set the tested time and to begin the test.



When you start the ADSL BER Test, the following progress window will display the connection speed as well as the length of time that the test will run for. At any time during the test, click on the **Stop** button to terminate the test.



When the test is complete, the following window will display the test results showing the test time, total transferred bits, total error bits and error ratio.
